v4 or L4 plugin from alessio? sml: :p Does 13.10 keep the xorg.conf config file? I had a graphics card with a proprietary nvidia driver and in 13.04 I could add "nvidia" to my.conf file and have it work. But in 13.10 I have to edit xorg.conf, which doesn't seem to be written to anymore. (btw. It's for a gamepad, if it matters) Hello all. I have a problem. I have been running ubuntu for several years. I just upgraded from 13.04 to 13.10. I had a terminal open (gnome-terminal) running ssh -D 8999 -i ~/.ssh/id_rsa.pub user@host. After I upgraded, I cannot connect to that terminal. It just sits there waiting for a response. I can ssh to host just fine. I have reinstalled ssh but that did not help. Any suggestions? osse: takamarou: try ssh -v sml, I did. What does it tell you? What am I looking for? reisio, thanks. I'll take a look. That's a lot of hardware :) sml, it just sits there. It is connected to the server and I can ping it and ssh to it from another client just fine. Just can't connect from the terminal... takamarou: sounds like it's timing out from ssh or your program is timing out from the terminal sacarlson, I can connect to it via the ssh client from another client. I tried closing the terminal that it is sitting in and opening a new terminal and trying to connect to the same host. Still nothing. It just sits there. 520fdb1ae7
