In component main, is optional. Version 36.0.1+build1-0ubuntu1 (vivid), package size 14 kB, installed size 66 kB What is wrong with my computer? Hello, I'm having some trouble with a bootable drive, it's been stuck at "Loading, please wait..." for about 12 hours now. I tried disabling splash and quiet and I tried setting a rootdelay to 4, but it still does not boot Everything works fine on my ubuntu live usb and my windows computer I tried searching for the "Loading, please wait..." message on google, but I didn't find anything This message seems to be unique to the drive I'm trying to boot from is there a log I can look at to see why it's hanging? Is there some kind of setting I need to change in the UEFI/BIOS to disable this boot sequence? I'm on Ubuntu 15.04, if that helps lotus 520fdb1ae7
