Cipp/c study guide

This cipp study guide is written for those preparing for CIPP/E or CIPP/US exams. The guide contains everything you need to know about the exam. This cipp guide also contains helpful tips to help you prepare for the IAPP exam. IAPP - CIPP, CIPM, CIPT International Association of Privacy Professionals (IAPP) offers international privacy certificates. Certificates are accredited by ANSI/ISO. These certificates are widely recognized and this is considered a standard benchmark for professionals in the privacy industry. IAPP issues the following certificates: CIPM (privacy operations), CIPT (technology), CIPP (laws and regulations). The CIPM certificate is designed for managers and is becoming increasingly popular with professionals in various industries. It's about privacy management. This is for professionals who implement privacy programs. The CIPT Certificate is designed for I.T. Professionals. This certificate is the least popular and will soon be completely redesigned. The latter option, certified Privacy Certification (CIPP), is the most popular among IAPP certificates. CIPP has different options, and the two most popular certificates: CIPP/E - is about privacy in Europe. GDPR plays a central role in this. This certification is of a legal nature. You'll learn all about the most important privacy legislation. CIPP/US - It's about privacy in the United States. It should be noted that there is no single privacy law in the United States, so this certification is dedicated to various privacy laws, such as HIPAA's health privacy law. Other lesser known CIPP/C options are for Canadian professionals and CIPPA for privacy professionals in Asia. The U.S. Government Professionals Certificate (CIPP/G) is currently inactive. Various large law firms are behind the CIPP certification, and this contributes to the success of this certification. An alternative to IAPP certification is a Certified Information Systems Security Specialist (CISSP). The certificate is issued by the International Information System Security Certification Consortium. This consortium is also known as (ISC)2. IAPP training materials for CIPP/E and CIPP/US You can download various documents on the IAPP website to prepare for the exam (. The most interesting documents are body of knowledge and exam plan. The Knowledge Authority provides a list of subjects that you should cover in preparation for the exam. The exam scheme is more interesting; it says how important each component is in the exam. Each item in IAPP carries different grades, so it's important that you get to know the plan to understand the most important sections. In addition to these documents, you also other valuable material on the IAPP website. These include the CIPP study guide, an authoritative list of resources, and a privacy glossary. You can download these documents, but note that they do not matter much compared to body knowledge and exam plan. You can search in IAPP settings where you can follow the classroom. It takes about two days. You can also follow online training materials available on the IAPP website. (Note: This is not a complete guide to preparing for the IAPP test. Before you get used to it, download both documents and study them carefully! Please note that the material changes by about 10% each September 1. If you register in advance for an IAPP account, chances are that you will receive a coupon code with which you can download a practical exam for free. Eduardo. IAPP, 2018. Please note that the book does not contain any changes made in September 2019. CIPP/USA - U.S. Private Sector Privacy, Second Edition. Peter. Swire and DeBra Kennedy-Mayo. IAPP, 2018. Please note that this book has not been updated to reflect changes made in September 2019. These books cost \$75 and are included in official IAPP courses (online or in class). You can also order them from the IAPP online store. Books do not contain all the materials required for the exam. However, it contains all the basic materials of the course. If you want to order a book, we advise you to go for an e-book version that is easy to navigate or search while studying. For CIPP/E: The European Union has made a free e-book available to help your preparation for the IAPP test. You can download the e-book here. CIPP/E and CIPP/US exams? Here are some tips and tips to help you prepare for your CIPP exams. The CIPP exam is tough. You will need to prepare carefully for the exam. According to IAPP, 30 hours of training time should be enough, but most people say they need more than 60 hours to prepare adequately. There are many questions that can literally be extracted from the book. So you should read the guide to studying CIPP carefully. Make sure you know the most important articles and that you also know, for example, what is stated in Article 15 GDPR. Take a look at the articles of the law, are the most important in the exam (Blueprint Exam). There are practice questions online. You can also download practical questions on the IAPP website. For any additional questions, follow (online) training or take a look at Amazon. You can find here, for example, the book Real CIPP/E Prep: American Guide to the European Data Protection Act and General Data Protection Regulation (GDPR) Gordon Yu or the full CIPP/US. Practice exam by Jasper Jacobs. Don't be fooled by the lack of practical questions. Most of the questions come directly from manuals, and the other part consists of question scenarios. For CIPP/E: Look for flash cards on the Internet that will quickly learn the most important concepts. Check here. For CIPP/E: always keep GDPR handy and read articles. If you want an additional explanation, you can also read solo concerts. They introduce GDPR. Check here for more useful information. Ask yourself regular questions like what I know about information obligations under GDPR or what I know about HIPAA and what does or don't fall under the hipAA scope etc. CIPP exam you can request and schedule an exam through the IAPP website. To do this, you must first register and purchase an exam voucher (\$550). After that, you can register for the exam at any test centre near you. Once you've completed your registration, you'll need to take a seat at your computer. You are not allowed to bring any subjects to the exam room. You will be given 150 minutes for both tests. You have to answer 90 questions with multiple answers. Please note that once you start, you can't pause time. If you decide to use the toilet, it will be at the expense of your time. Often, 150 minutes is enough to pass the exam. Most candidates experience some stress time when they start the exam. However, you will be able to complete several options for questions over some time, while script questions may take you longer. For more tips If you doubt the question, tag it and answer it later. Remember that you don't have to answer all the questions correctly. There are a few simple questions with multiple answers that you can answer correctly only by studying CIPP. You will need to explore the broad answer to most of the script questions. In addition, some of the questions are experimental and will not be added to your total score. Don't be fooled by scripted questions. These are the questions that are outlined in the long case. There is a lot of information in the script that you don't need at all when answering your question. If you haven't had enough time to prepare properly, reschedule your exam. This is done at least two days before the exam date. Good luck! We offer an excellent exam preparation course that includes a detailed overview of the entire textbook, IAPP style practice and various instructional videos. This combination optimal preparation for the exam and high chances of superiority on the first attempt. Sign up here. 6-18-20 UPDATE: We have transferred the Google Drive resource project to the student privacy law organization in SCU Law. If you want to access the exam notes, outlines and practices we've created, please send a quick request to join the drive to plso@scu.edu. You can also join their CIPP mailing list here. A fair warning, the next post is almost two years. - For an exam so heavily focused on information sharing, there is a surprising lack of it between privacy professionals regarding this certification. I seek to change this by starting a collaborative, open source resource for anyone trying to address this privacy achievement. I write these reflections about two hours after passing the exam in an attempt to bring a fresh perspective on the study and acing certificate. Online research resources are small if you don't consider the resources you can (should) purchase from IAPP. Google searches for how difficult the CIPP/US exam or CIPP/US exam tips will lead you to: (Full disclosure bias: I'm a law student at SCU, but a useful tactic is actually helpful, especially the point about mastering the little things) Plenty of forums about how awful the test is and lawyers who claim to have 20 years of privacy experience but still managed to fail the exam. I won't tie those here because I carefully advise you to stay away from these conversations. They're going to strain you before you sit down for the test. If you decide to venture down the path of the forum anyway, I can assure you I've read them and they are incredibly exaggerated and melodramatic. Tldr, take them with a grain of salt. And that's about it. So my inspiration is to start this conversation. Training at CIPP/TIME USA for training: IAPP recommends at least 30 hours of allotted time for training and preparation for work. I studied for about 80 hours or 2 full weeks. Of course, I'm what most consider 0L without starting law school yet, so I was already at a disadvantage of having to learn a lot of the legal framework (civ pro) that come naturally, most 1-3Ls and experienced lawyers. However, I still disagree with the 30-hour recommendation of IAPP. 80 hours is extreme, but in order to truly master the test, you have to master 350 pages of the book. For most legal students, 350 pages wind up, but the material is dense and some of the tricky chapters require extra attention. I would like to publish at least a full week (40 hours minimum) full-time dedicated training. How to prepare: Read and master the book: Your only priority for the next 40 hours is you're ready to master the IAPP CIPP/US tutorial. It's not cheap, but you most likely won't pass without it. The whole exam erupts with text from the book. My approach is to read read in full once, highlighting important points. Then I went back to the denser chapters and reread it. Medical, financial and workplace privacy make up the majority of the exam, so I focused on these chapters in particular. After reading and rereading, I watched an accompanying online training video from IAPP and took notes. Online training is not great, and looking back, I probably should have missed it. This is a ravaged down version of the text and, full of warning, some of the material is flat out incorrectly. This is another affordable resource if you have time to kill and are looking for a primer in the tutorial, but it's definitely not a replacement for mastering the book. Returning to the question of learning the little things, it is important to study what may seem to be arbitrary details about each of the laws. Such questions as, CALEA is also known as - stupid but fair play (the answer is the Digital Telephony Act). Yes, you should also know the little nuances of most basic state infringement notice laws too. Specifically, California, Texas, Illinois, Tennessee, New Mexico, Delaware, Massachusetts and Maryland, as each of these states added their own interesting privacy talent to their infringement laws. Notice the small details. Make Flashcards: The IAPP website has a glossary for all CIPP/US conditions. Go through it and make a note card for each of them. I ran across my entire note card stack once because that's all I need after spending half a day just writing out the definition manually. The goal here is not necessarily to memorize key terms, but instead, to recognize and understand them. The exam will not ask what is the definition of pre-emption? rather, it will use pre-emption or consent decree or habeas data accidentally in a question or scenario, and you must understand the context to respond correctly. In addition to the glossary terms, I would like to add a few maps for the steps you need to take to properly plan to prevent data loss or key points in creating a privacy system. There were a few questions that asked what was going on in discovering or building stages of a privacy plan where taking steps perfect in memory made it ten times easier to answer. To outline the tutorial: The last major part of my training plan is to pass every law mentioned in the book and formally spell them out. The frustrating aspect of the book is that they scatter the laws in all chapters. For example, you'll read about the FCRA in the Financial Privacy chapter, but then the workplace privacy chapter will add additional provisions. I tracked down all the disparate provisions and combined them to get a complete and complete picture of the law. Although I recommend writing my own plan because it will help to make these laws a keepsake, I attached a copy of my full plan as an additional resource resource Take a sample exam: just buy it. \$25 steep for 30 questions, but just do it. You will thank yourself later when you see five or six of these questions on the exam itself. I would like to post a sample exam here, but getting an IAPP claim isn't quite on my law school bucket list. Develop interest in the privacy law: This should be obvious, because why else are you learning for this certificate? This is an optional step of study, but one I highly recommend. Before even deciding to take this exam, my natural interest and curiosity about privacy and internet law forced me to consume tons of news articles and blog posts about these subjects. When you become a member of IAPP, you will have access to their dashboard. Read the daily resources that are available to you. Follow other privacy professionals on Twitter. Read legal blogs. Keep up to date with existing privacy laws in your state. I read all 10,000 words of the California Consumer Privacy Act before taking the test (don't do it if you value sanity). The more interested you are in the subject, the less memorization you will need, and the easier it will be to retain the text. Although out of the scope, there were a few GDPR questions on my exam today that were never brought up in the textbook. I was able to answer these questions only because of the external reading I did on THE GDPR prior to the exam. I think these were experimental issues, but you never know. Be interested and get informed! I've added a list of blogs at the end that I follow that help me stay up to date with current privacy issues and technologies and discussions. Taking the CIPP/US exam This test was by far one of the strangest exams I have taken since my operating finals systems as a student. The exam is difficult even after you have devoted time and energy to the aforementioned research tips. The difficulty, however, stems not only from your understanding of the material, if more from the structure of the test itself. To throw IAPP the proverbial bone, it's a relatively new exam and I think test makers don't have an easy job. Be prepared for grammatical typos, and strange attempts to ask the same question two or three different times. My best advice is to go slow and read the questions carefully. You have about 1.6 minutes to question, given the 150-minute time frame, so it's enough time to pass the exam at a relatively slow pace. Be on the watch for double negatives and notorious EXCEPT questions (think LSAT). On the same note, I took the exam just as I tackled LSAT. Read the question, take the reasonable assumption about what the answer should be, choose which best fits your guess. Some of the multiple choices are identical down to one or two words (and switched to or, for example), so you should read the selection carefully too. Teh Teh structure of 90 standard multiple choice questions with five or so script-type questions thrown into the mix. For script-based questions, I recommend a familiar method of identifying problems. The scripts are riddled with obvious privacy issues that IAPP wants you to choose. Find them, mentally tag them, and fly through the questions. Concluding a CIPP/US exam is not as hard as people on the internet make it to be. It's relatively tame compared to, you know, your state bar exam, for example. It is a test structure and the lack of internet resources that make it seemingly complex and unnecessarily mysterious. Put in a time and effort to master the book, get information about privacy in the news, and ignore the negativity on the Internet and you will be golden. I've attached my plan and some other research resources below: Other Research Resources: My Plan: This amazing quiz set (not mine): Privacy, Technology and Internet Law Blogs I Follow: cippc study guide pdf
