It comes with a full system including a high-end digital signal processor, a precision amplifier, a USB sound card, a speaker, and a pair of Earspeakers. Not sure what to do with all those devices you got from your cousin? It's a challenge that Vocalsynth 2 has prepared for you. Using the industry standard Vocoder, Compuvox, Polyvox, Talkbox and Biovox, you will turn each into a production tool. There is nothing like the Vocoder that can produce so many shapes, and there is no better way to make a track than to master the Biovox. Each device allows you to create a unique sound that cannot be found anywhere else. Features Vocoder There are two main vocoder models: Vocoder 2.0, and Vocoder 3.0. The difference between these two is that Vocoder 3.0 is not programmable. The Vocoder is a device that allows you to manually modulate a sound. Vocoder 2.0 is one of the most popular vocoder models in the industry. It features a variety of parameters for an instant workflow, allowing you to change the sound of a vocal by moving sliders or the knob. Vocoder 2.0 comes with twelve of its most popular sound banks for instant access to a huge amount of sounds. Even if you have the Vocoder 3.0 version, you can use Vocoder 2.0 sounds because they are compatible. Compuvox The Compuvox is an award-winning vocal processor that delivers advanced processing effects. It's a device that allows you to manually modulate the sound in your track. In the Compuvox, the sound can be modulated by using up to four filters: Low-Pass – With the Low-Pass filter, the sound is boosted as frequencies below a certain threshold are filtered out. High-Pass – With the High-Pass filter, the sound is boosted as frequencies above a certain threshold are filtered out. Band-Pass – With the Band-Pass filter, the sound is boosted as frequencies in a specified frequency range are filtered out. Low/High/Band-Pass – With the Low/High/Band-Pass filter, the sound is boosted as frequencies below, above, or in a specified frequency range are filtered out. Polyvox The Polyvox is a real-time echo that mimics the presence of vocal effects and delays.
