AJAX allows web pages to be updated asynchronously by exchanging small amounts of data with the server. This means that it is possible to update parts of a web page, without reloading the whole page. What is an Ajax call ? An Ajax call is an asynchronous request initiated by the browser that does not directly result in a page transition. A servlet request is a Java-specifc term (servlets are a Java specification) for servicing an HTTP request that could get a simple GET or POST (etc) or an Ajax request. What is the XMLHTTPREQUEST ? XMLHttpRequest (XHR) is an API available to web browser scripting languages such as JavaScript. It is used to send HTTP or HTTPS requests to a web server and load the server response data back into the script. AJAX Tutorial With Suitable Example HTML Page Ajax Example function loadAjax() { var xmlhttp = new XMLHttpRequest(); xmlhttp.onreadystatechange = function() { if (this.readyState == 4 && this.status == 200) { document.getElementById("msg").innerHTML = this.responseText; } }; xmlhttp.open("GET", "load_data.txt", true); xmlhttp.send(); } This content will change after click on button Note: Create a text file name "load_data.txt" write some contents inside this file, this text file contents will display in after clicking on button PHPServer Side ProgrammingProgramming Using Ajax to download files is not considered to be a good idea. Instead, window.location = or document.location should be used.The 'window.location' has the following characteristics −JavaScript enabling is requiredIt doesn't need PHP.It helps show the content of the site, and redirects the user after a few seconds.Redirect can be dependent on any conditions such as −$success = 1 if ($success) { window.location.href = ' '; }A variable named 'success' is assigned with the value of 1. When this condition is satisfied, the window.location is used.On running, the user is redirected to the website ' ' Published on 07-Apr-2020 15:09:01 In every chapter, you can edit the examples online, and click on a button to view the result. Let AJAX change this text Try it Yourself » AJAX Example Explained Let AJAX change this text Change Content The HTML page contains a section and a . The section is used to display information from a server. The calls a function (if it is clicked). The function requests data from a web server and displays it: function loadDoc() { var xhttp = new XMLHttpRequest(); xhttp.onreadystatechange = function() { if (this.readyState == 4 && this.status == 200) { document.getElementById("demo").innerHTML = this.responseText; } }; xhttp.open("GET", "ajax_info.txt", true); xhttp.send(); } AJAXAJAX is not a programming language.AJAX is a technique for accessing web servers from a web page.AJAX stands for Asynchronous JavaScript And XML. What is AJAX? AJAX = Asynchronous JavaScript And XML. AJAX is not a programming language. AJAX just uses a combination of: A browser built-in XMLHttpRequest object (to request data from a web server) JavaScript and HTML DOM (to display or use the data) AJAX is a misleading name. AJAX applications might use XML to transport data, but it is equally common to transport data as plain text or JSON text. AJAX allows web pages to be updated asynchronously by exchanging data with a web server behind the scenes. This means that it is possible to update parts of a web page, without reloading the whole page. How AJAX Works 1. An event occurs in a web page (the page is loaded, a button is clicked) 2. An XMLHttpRequest object is created by JavaScript 3. The XMLHttpRequest object sends a request to a web server 4. The server processes the request 5. The server sends a response back to the web page 6. The response is read by JavaScript 7. Proper action (like page update) is performed by JavaScript
