Although Android users can find and download apps in a much larger volume than our iOS counterparts, detecting apps on your device is still a task that is largely related to the Android market. There are other app stores and apps that will help you find new apps that you enjoy, but the official Android Market is the only one that regularly updates and does a better job of helping you find apps that you would like based on other apps that you may have installed. Android Market Platform: Android Price: Free it comes with your phone! Maintain a list of apps you installed or purchased for reference or exchange later. A simple search tool allows you to quickly find apps you're already looking for and browse offers for apps based on the names you've been looking for. Application lists provide alternatives in the form of users, also viewed and users also installed, complete with their market rating and price. Staff Choice and Editors' Choice sections guide you to popular or particularly useful apps on the market, and featured apps are always on the same page. The search tool often displays apps with approximate functionality if the app you were looking for is not available on the Android Market or is only available on another platform. Swipe from left to right to see high-paying, free, box office and trend apps in all categories and find out what other users are downloading. The beauty of Android is that you are not limited to any one app store or source for new apps when you want to try something new or find an app that fits your needs. At the same time, unlike iOS, there is no single repository to create an elegant tool such as Dscovr Apps that will help you find new apps based on already installed or those you would like to try but don't want to pay, for example. Even so, Google is doing a great job with Android Market in making it easy to search and find the apps you're looking for, and even it's easy to find new apps that other users might have chosen instead right there on the app information page. This information is available both online and on your phone when you're browsing the app market, and you can see which other similar apps users have watched or installed instead of what you've been looking for. Long gone are the days when the first page of the market had a simple list of new or most downloaded applications. Editors' Choice and Staff Choices on app screen are actually useful tools that you discover new apps in this category, and a category breakdown will help you drill to find popular apps based on their function or purpose. The best free and paid listings show you what everyone else is downloading, and Trending will help you see apps all talked about or new and hot on the market, even if people don't necessarily buy or download them en masse. Teh Teh The problem with the market when it comes to opening up is that it is a market. It's a store and it's not designed to help you find apps that you would like based on you, it's designed to make it easy for you to find and buy apps. This means that there are no tools that will help you find new applications based on those you have installed, or based on those you enter, or based on some of the functionality that you are looking for, for searching through the category. Unfortunately, the concept of searching for applications based on other applications is limited to the search window in Android Market. AppBrain (free) saw its heyday when the Android Market was in a much more accurate state than it is now. Back then it was the only way to track the apps you installed on your Android phone, share apps you downloaded from other people, and one of the first services that allowed you to install apps directly from the Internet. It still does all of these things, and is still a great resource for apps, allows you to share installed apps and discovered apps with others through Facebook, and offers a great curated selection of trending and interesting apps based on AppBrain employees. Best Apps Market (Free) focuses on free apps almost exclusively, and highlights some of the most popular and best free apps in several categories selected by the people behind the app. Consider it an alternative to Android Market, which focuses entirely on free apps and offers offers for similar apps based on those you browse. It's also easy to share and evaluate apps you'll find on your favorite social networks. Do you have another Android app that we've overlooked, or a preferred method of finding new Android apps? Share it in the comments. Lifehacker's App Directory is a new and growing catalog of recommendations for the best applications and tools in a number of these categories. End of the line! Epithets like beautiful and well designed get thrown around pretty liberally when it comes to applications. But several Android apps have been received with such general recognition as Timely. Timely is a watch app developed by Bitspin, a team of four Swiss developers, for four months. While it's obviously hard to deliver a mind-blowing experience in a mundane watch app, Bitspin has managed to impress reviewers and users alike with polished timely and thoughtful design and functionality. One noted the Android app designer in particular was so fascinated by the timeliness that he announced it as the best Android app he had ever seen. Lehtimäki, who literally wrote a book about the development of android UI interface, leads the development of Android for a British startup and writes about the design of applications in his blog Android UI Patterns. This is the conclusion on his blog on timely: quote qtext I'm speechless. This is the best android app I've ever seen. This is the one I will send to the designers I work for This is an app that I will keep in mind in my presentations and it is an app that will wake me up every morning. qperson qsource qposition center quote qtext We, as an Android community, are indebted to the timely signaling of the watch team. Hopefully companies around the world will see this as a challenge and proof that you can be awesome on Android. Let's hope we see this as the beginning of a trend. Let's show the world that you can move Android design forward and create stunning apps without breaking guidelines. The guidelines are not restrictions, they are there to help you! qperson qsource qposition center qtext quote Now, if you haven't, go to Google Play and get yourself an app that defines the next generation of Android design. qperson qsource qposition center I encourage you to read the entire post of Juhani, where he makes some great points on Read also: This is a great write from Mathias Duarte about the rules of Android design and when you should and when you should not break them. Others in the Android community echoed Juhani's sentiments. Just Google Timely News for a wide range of posts that praise it. Our very own Nate Swanner called it gorgeous and sublime. Of course, there are some that are not reverent with timely. My colleague Joe Hindi stated that the app, or any watch app for that matter, is hardly worth a trip to the blogosphere. And there are some who point out that parts of the app's interface are seemingly inspired by Rise, the iOS app. Is timely really the best Android app ever? Personally, I like Timely - I'm impressed with its functionality and design and love how intuitive and sleek it feels. With that said, I think some of the hyperbole swirling around it is a bit bloated. Yes, it's probably the best watch app for Android, but is it the best Android app ever? I'm not sure. How about you? Have you tried it in a timely manner? Is it worth the hype? What are you looking for in terms of design in Android apps? What examples of great app design can you come up with? The sound is off in the comments. If you have a Pebble and it's connected to an Android smartphone, you've probably felt left out in the dark compared to your iPhone-touting friends. When Pebble unveiled a thinner, more stylish Pebble Steel smartwatch at CES in January, the Pebble app store also went live - but only for iPhone users. It took two months, but, today, Android users can rejoice. Pebble has introduced its dedicated app store to the Google Play app market. In addition, Pebble has announced a new partnership of the app with companies such as eBay and Evernote to name the couple. Evernote allows Pebble users to access key Evernote features such as checklists, reminders and laptop laptops of a smartwatch. eBay, meanwhile, allows Pebble users to access eBay channels, browse products and add items to their wish list for a later purchase through your smartphone. Related: Pebble's \$10 million Crowdfunding Secret: Keep It Simple App Center is central to Facebook's search for high-quality social apps, whether online or on a mobile phone, Matt Wyndome, who led the team that built the center, said at a launch event in San Francisco. The center doesn't shop so much as it is an opening tool. Wyndome said the company realized that it needed such a center when people would constantly ask them how they could find great apps, and the company has no answer. The center launches with information on more than 600 apps, including Nike, Stitcher Radio, Draw Something, and Pinterest. Users can access the center through a tab at the top of the App section on the left side of NewsFeed. (The bookmark will be rolled out in the coming weeks. Pages also contain links so users can access apps right away, whether they're on Facebook or the iPhone App Store or in the Google Play store. More than 230 million people play games on Facebook every month, the company said, and more than 130 games have more than 1 million users a month. Last month, Facebook has pushed users to the Apple App Store 83 million times.
