2002 jeep liberty fuse box manual

Bubbles burn out over time. There is no way around this fact. And if this light bulb is part of the tail light of your Jeep Liberty you better replace it-- and pronto! Driving around with a burnt back light can make you eligible for an expensive ticket as well as time-tightening in proving that you have done the repairs. When replacing the tail light in the Jeep Liberty, make sure that you have a proper lamp that has been designed to replace the rear light in your particular model and year of Freedom. Examine the rear light and determine which light bulb to replace. There are three light bulbs in the tail light and, in all likelihood, only one of them should be replaced. Determine which one. Open the tail door. This will reveal two screws installed towards the tail light assembly. In most cases, these screws will have a star-shaped head that requires a wrench of the island T-15. Remove both screws. Wiggle plastic tail light cover. He should step back easily. You will see wires leading to the back of three light bulb sockets. Determine which bulb is a bad lamp (from Step1). Grab the base of the bad lamp and twist counterclockwise until the assembly lamp lifts straight. Turn on the assembly of the lamp so that the light bulb collides with you. Gently press the lamp down into the socket and give it a 1/4 counterclockwise turn and then release the pressure on the lamp. The light bulb will pop out. Tap the new light bulb down into the socket and rotate it for a quarter of a clockwise turn. Now it will be locked in place. Turn the assembly and insert the lamp and assembly back into the lamp holder and turn clockwise until the light bulb is locked in place. Replace the plastic cover and two mounting screws. Perhaps especially if you have a used Jeep Liberty that star-shaped screw heads may have been replaced by standard Phillips head screws. If so, you will need a Phillips screwdriver to remove the two screws. Replace the lamp with the right-size lamp for your year and the Jeep Liberty. Do not use excessive force when removing or reinstalling the lamp, or you can destroy the lamp. The T-15 Island Wrench Key Replaces The Lamp Trailer Image caption Diana Mastepanova's suspension from Fotolia.com The car's suspension seamlessly connects the steering system with tires to provide the driver with a smooth and safe ride. A good suspension will give the driver excellent control over the car even on the worst roads. The Jeep Liberty is a heavy SUV, weighing about four tons. As a result, Liberty can experience suspension problems quite regularly. The driver may suspect free steering if the steering wheel does not fully control the movement of the tyres. A common sign is the wandering wheel, which seems to hover from side to side How you drive. The reason for the free steering is a free or faulty bolt joint that reduces the driver's control of the driver Car. Jeep Liberty has a few recalls for this particular problem. We perform monthly maintenance checks to confirm that all bolts in the suspension are working properly. If the problem is free steering, fix the problem as soon as possible. This condition can be very dangerous, especially if you usually encounter many potholes and sharp turns. Pulling is a common problem in older versions of Jeep Liberty. The traction is indicated if the SUV gravitates to one side when the wheel is aligned perfectly straight to the road. Pulling can be a suspension problem if the tyre alignment has been changed due to an accident or faulty part. However, pulling can also be due to tire wear or improper tyre pressure in the tires. Replacing suspensions or leveling tyres is much more expensive than replacing or inflating multiple tyres. A mechanic can be found to determine the actual cause of the problem. Some engine noise is expected with the Jeep Liberty. However, a very distinct screeching noise at low speeds can be a sign that there is a problem with the suspension of the car. The noise sounds like two pieces of metal rubbing together. The cause is a faulty or worn steering strap, also known as a serpentine strap. Its goal is to control several engine components at the same time, including steering pumps. When it fails, it slides against the shafts rather than turning them, causing a distinctive screeching noise. The sound can be temporarily stopped by applying the belt bandage to the inside of the belt. However, this is only a temporary solution, and the belt will eventually have to be changed. When the wheels are out of alignment, the steering wheel of Liberty tends to shake at normal highway speed. This can occur due to a collision, loose bolts or a collision with a pothole. In some cases, the tyre alignment can be so off that the rear and side mirrors will vibrate significantly. Jeep Liberty has several suspension reviews: In addition, the significant weight of the SUV increases any problems with the suspension. The spark image of zbigniew Novak from Fotolia.com Engine and chassis of your Jeep Liberty are designed to withstand the rigors of everyday driving as well as the requirements of rough off-road use. To maintain the integrity of the mechanical systems of your Jeep Liberty, it is recommended by the manufacturer that you perform a customized approximately every 60,000 miles. Doing regular maintenance on your car will protect against a catastrophic failure. Change the oil and oil filter on Jeep Liberty as part of its setup. Precipitation in an oil pan, on the face of the valve and around the piston rings can cause heat engine failure. Drain and replace the transmission Automatic transmission synchros, which are the gears responsible for converting power into a drive shaft, can heat up critical critical as a result of the capture of the gears and the complete loss of transmission. Use Dexron or Mercon liquid in the powertrain of your Jeep Liberty. Replace the back and anterior aus of liquid with synthetic liquid. Check the air filter to determine if it should be replaced. The dirty air filter will look dark grey or brown. Changing the air filter is a cheap insurance against the introduction of foreign objects into the Jeep Liberty entry system. Replace six ignition candles with fresh corks. The new, properly firing ignition candles will ensure proper combustion in the cylinders as well as maximum fuel efficiency from your jeep's engine. Change the ignition candle coil wires. Heat from the engine compartment eventually causes damage to the coils, which leads to increased resistance to the coil and reduced energy transmission. Make sure you plug each ignition candle coil into the appropriate cylinder. Incorrectly connected coils will cause the engine to misfire. Synthetic blend of motor oilOil filterFront axis liquidReir axis fluidAir filterTransmission fluidSpark corks (6)Lighting coil wire (6) Moves very easily smoother, The rough and uneven terrain of the Handlebar is pretty handy to grip and adjustAmple storage spaceEasy to pushThe steering wheel can not be adjustedDifficult carry stroller once it has been folded Freedom 3-Wheeler cheated with large wheels, mp3 player speaker, children's toy, two winks and a lot of storage. Among its drawbacks is a very small bonnet window and a narrow grip of the steering wheel. It can also be too big to squeeze into cramped areas like a busy supermarket aisle. He received mediocre scores for ease of use, agility and stability. Available in the energy sector by kolcraft.com. See all 4 photosMotortrend StaffwriterSep 5, 2008Ger's pruning, apparently continues at Chrysler. For three years, expect Jeep Liberty and its closely related brother, Dodge Nitro, to merge into one model, according to Stephen Landry, Chrysler's vice president of sales for North America. Landry made his comments on the Toledo Blade.Landry statement doesn't come as much of a surprise, given Chrysler's ongoing attempts to cut overlapping models from the automaker's three brands. Chrysler's Jim Press has already announced its goal to eliminate 11 SUVs from the Chrysler, Dodge and Jeep lineup. In May, we learned that Chrysler had canceled its Dodge Icon Icon Plan for the Chrysler brand, instead of directing more money to the development of small cars and most likely paying Nissan to help with the replacement of Sebring / Avenger. Despite the impending axe, which Reportedly falling for one of the cars, Landry says that sales of Liberty and Dodge Nitro together are meeting the company's goals for this segment. From the beginning of the year to August, sales show Jeep Liberty at 49,330 and Dodge Nitro at 27,540. Nitro is going much worse overall, with reports of a 194-day supply, Blade reports. Our bet on nitro is the vehicle to go into automotive history, especially with Chrysler reportedly moving away from the square, angular design look. Chrysler hopes to combine two SUVs into one by 2012.See all 4 photosTHE LATEST IN CAR NEWSShare on FacebookShare on Twitter Nathaniel Welch of North Carolina Uwharrie National Forest is riddled with off-road vehicle trails, the most famous of which, Daniel, is rated extremely difficult. Daniel's car-mangling ferocity is such that the park plans to fill some of the most treacherous ledges, smoothing the boulder-strewn ascent to make the terrain more accessible. Luckily for me, they haven't done it yet, because I'm here with the American JK350 Expeditionary Vehicles. And she doesn't need help. AEV is best known for building six-figure dream trucks, turning jeeps into Hemi-powered monsters such as the Brute Double Cab. But the company is also building more modest machines, such as the JK350, a carefully modified Jeep Wrangler Rubicon that does not enter the financial territory of Aston Martin. The package starts at \$14,897 and brings a 3.5-inch suspension lift, front and rear bumpers, wine-warn, new wheels, and 35-inch BFGoodrich Mud-Terrain tires. There are also many AEV icons, so your friends know that you don't just bolt on a cheap lift kit from Slappy's Jack'R Up. Matt Feldermann, AEV's marketing coordinator, brought JK350 to North Carolina, about 700 miles from the company's Detroit headquarters. Which brings me to the first revelation about the AEV-modified Rubicon: Despite his upgraded off-road gear, he's designed to mind his manners on the sidewalk too. The suspension kit includes components that adjust the geometry of the steering to reduce the roll center of the vehicle, minimizing the side head snap that can hit people in tall vehicles. When Felderman hands over the keys for an hour-long trip to the track, he says, Don't be afraid to throw it at some corners. This may be the first time anyone has ever said that about Wrangler. Nathaniel Welch (Photo: Nathaniel Welch) And in fact, the JK350 is wonderfully wet at the roads-stable and accurate. The real action, however, occurs when we reach the first ledge at the bottom of Daniel. It is almost a vertical rock slab, maybe 4 feet high and scars from rubber. In the ile at the base we see tires, from where someone else just spun. But I go up and over again. Either way, that's the plan. On the first few attempts I get the front tires over the ledge, but can't enough traction to maintain momentum. Eventually I get the confidence to stay on the throttle and the big jeep claws its way through the obstacle. The rest of the climb offers occasional challenges for JK350- and more or less permanent for Wrangler Rubicon shares we have brought for comparison. Here Wrangler shares can be tagged along with AEV, but let's just say that the driver will do a lot more charm. Yes, \$60,000 is a lot for Wrangler. But at this price, how many vehicles can comfortably handle a 1,400-mile round-trip interspersed with expert-level rock crawl? Only one, the best jeep that the jeep doesn't build.
