Wii u error code 103 2001

Over the past few days I haven't been able to connect to the internet on my Wii U. Recently, I've got a new modem that I can connect to the internet through, so we threw away the router as we didn't need it. Except for my Wii U, which won't connect to the internet. It connects to a network device, but not to the Internet. My modem is ubee (That's really all I know about it.) Here's (basically) everything I've tried so far: -Putting IP and DNS manually on connectivity -Setting up DHCP Static Leasing.. Whatever it is (the modem control panel has the ability to do this, but it doesn't work.) -Power cycling modem -Checking my MAC filtering list. Nothing was filtered. -Reboot wii U about 3 times - Adding 10 to the end of ip in connection I didn't try using Ethernet to get the Wii you to connect, but I have no money. Note that things being on and near the Wii U, or modem interferes with electronics, is not a problem, it worked just fine before I got my new modem, and the Wii U hasn't been moved around since I got it. The problem seems to be with my modem because I have seen a lot of other people with my problem and they use the same modem as me. As additional proof of my modem is a problem, the modem is pretty bad overall. When I first got it, the internet came out for a few seconds every 10 minutes or so. This was a problem when playing online games. The Wii U should be completely updated, but I have no idea. It doesn't get any internet anymore, so I can't tell. I just got the Wii you and it seems it shouldn't like my router (Linksys E3000). No other devices seem to have a problem. When I enter the settings in the system menu, the router connection is successfully terminated, but the Internet connection does not end. I've tried with DHCP as well with manually defined IP and DNS. The error is displayed either 103-2101 (with DHCP) or 103-2001 (without). I don't know what to try next. Help? Click here for all of GamesBeat's Nintendo Wii U launch coverage. If you are like a significant number of new Nintendo Wii U owners (myself included), the automatic console connection feature to get online doesn't work for you. If you get an error code 103-1002 or any other notification that a Wii you can't communicate with your network device, here's what to do: Go to Connection Types, Hit Manual Configuration. Take SSID. Lime is the right type of security (this is very important, obviously). Put the password correctly. For an IP address do not automatically get. Open cmd in your computer, type into ipconfig (Windows computers, OSX users view the message at the bottom), bring this IP address, but add 10 to the last number, so 192.168.0.1 will be entered as 192.168.0.11. Enter the rest of the inside, such as the subnet mask and the default gateway just the way you see it in ipconfig. Now hit next and then hit the set-up for DNS. When asked about DNS, don't auto-take. For the first server put in 8.8.8.8. For the second server put in 8.8.4.4. Hit next, and don't install a proxy. Leave MTU by default. It should work if you don't check the IP and that is internet IP No. 10. These destinations come straight from official Nintendo support forums, and they work for a lot of people. I can also confirm that it fixed any problem I had (that none of my other consoles, portable devices or iOS devices ever had), although I didn't need to add 10 to my IP address. Did it work for you? We just got home with our Wii U, and during the installation phase got a few bugs trying to connect to our home network through our router. We solved our problem by manually entering the information. If any of you are struggling to set up the Wii U WiFi setting, try using the next steps we used to fix our problem. Allowed: Error code 103-1001, Error Code 103-1002 (and probably much more since the code is general) Step 1: On your Wii U go to Connection Types and Click Guide Configuration Step 2: Inve sSID Step 3: Choose The Type of Security (WEP, WPA, etc.). Make sure you choose the one that your router uses Step 4: Enter the security key/phrase Step 5: For ip addresses choose Don't automatically get Step 6: Go to your computer (on the same network) and open the CMD (Start qgt: (in the type of search field) cmd qgt: click enter (or select cmd) Step 7: In the type of CMD ipconfig and click enter. Step 8: Look for the first IP add-ons. Shouldn't be 10), and type it into the Wii U. Example: 192.168.0.15 should be 192.168.0.25 Step 9: Enter the rest of the information you need, such as Subnet Mask and Default Gateway. : 8.8.8.8 Second server: 8.8.4.4 (It's public, free Google DNS servers) Step 12: Hit Next, no proxy Step 13: MTU default rate (probably 1500) Your connection must now pass and work. If you don't want to use Google's fast, free, public DNS servers, you can search your ISP's DNS servers by switching to CMD and typing: ipconfig/all If you have any questions about how to get the Wii U up and running, we're happy to try to help. We'll add photos of the process later. If you've solved a problem while setting up, please share your fix to help others. So recently I tried to play online with friends on my Wii U. accept his friend's request I noticed that I had to connect to Wi-Fi. My Wii is connected to the router, but the router doesn't connect to the Internet. Teh Teh works great on all my other devices that are connected to Wi-Fi Wi-Fi
