cabletvbroadcastautomationsoftwarekeygen keygencrackautomati.netQ: How to update previous data instead of adding new data in Firebase? I am making a chatting app using Firebase and React. I have a separate function which updates the data whenever an event occurs (1 of the users sends a message, or 2 users send messages, etc). My question is how can I update previous data instead of adding new data? What would be the best way to do this? This is my code so far: const firebase = firebase.database().ref('chat/user/').orderByChild("id"); firebase.on("value", snapshot => { //Get the users names from snapshot

```
var user = snapshot.val(); // Add their name into the div document.getElementById("chat").innerHTML += `${user.name}`;  
//Send message to user id = user.id firebase.child("chat/user/" + user.id + "").push({name: message}); }) A: You will have to use  
this approach to make this work. Below is the example of one simple way to implement it. var firebase =  
firebase.database().ref('chat/user/').orderByChild("id"); 520fdb1ae7
```
