The potential of nanoparticulate delivery systems in the design of controlled release drug delivery has been an area of increased interest, with much work being done in order to improve the control over the release and administration of the drug via the transdermal route. This review article describes the various approaches used in the design of nanoparticulate systems for transdermal drug delivery. Special emphasis is placed on drug-

---

polymer conjugates, and how these can be designed to obtain controlled drug release, and in some instances, transdermal drug delivery. Transdermal administration of drugs, particularly via the skin, has been considered as a possible route for the administration of drugs in order to overcome the bioavailability issues that plague oral drug delivery. An understanding of the factors influencing transdermal drug delivery is therefore important. Q: How to create a table in Pyspark with a column with the distinct set of rows? I have a dataframe of a bunch of test scores (TestScore1, TestScore2, etc.) where I'm sorting them based on the total score. I want to create a table that looks like:

Total	Score1	Score2	Score3
123	4	3	1
124	3	2	1
125	3	3	1
126	4	2	520fdb1ae7
