I've been thinking about what truth means lately. Without almost any effort I can find contradictory articles, thoughts, perspectives, statements and opinions on almost everything that is being discussed today. I'm sure our election cycle is amplifying this, but I see this in a bunch of things I'm reading about technology as well. As someone who considers independent critical thinking to be extremely important, this dynamic is perplexed for me. A few months ago I wrote a post about TruthRank vs. TruthRank. I started a journey where I started separating the kinds of truths. In particular, I began to refer to your truth against the truth. When I tell your truth, I'm not talking about opinions. I am referring to your deeply held convictions. Your truth is the set of ideas that forms the basis of your worldview. It requires a huge act of will and introspection to change your truth. To better understand this, I would like to use a classic example of technology - that of Steve Ballmer's vision of the iPhone, and later his approach to mobile business. We take the stage with a classic interview with Ballmer at the time of the iPhone announcement in 2007. Now, let's take a look at Ballmer's reflections on this in part of this arc, Ballmer's great solution was to move Microsoft from 2014. As a software-only company to software- services and then software-devices. For many years, Microsoft has been dismissive of Apple's tightly coupled hardware-software business. In a final push for reactionary behavior, Microsoft bought Nokia in 2014 for \$7.2 billion and then wrote out \$7.6 billion just over a year later. Ballmer had his truth. He was stronger than an opinion. He shaped his entire worldview. He held it for seven years (or probably longer). And, at least in the case of the cell phone, it was completely wrong. It wasn't the truth. I see it in all aspects of the world. It's noisier in politics right now, but it's prevalent in all aspects of society. I am constantly getting involved in business and technology - both at the macro level (on the sector) and at the micro level (within a company). Likewise it is different from an opinion (which may be wrong and/ or invalidated over time), it is different from strategy. I always thought a strategy was the framework for executing your truth. Strategies evolve and opinions change, but your truth doesn't. And that's the problem. I see people who keep their truth for too long. They're holding on too tight. They turn an opinion into their truth. They extrapolate their truth from a small number of data points. Generalizing an experience to create their truth. They react emotionally to with which they disagree and anchor to their truth. They justify their behavior by clinging to their truth. In many of these situations, thinking it goes out the window. The internal prejudice behavior of your truth dominates. Stop being able to listen to other perspectives, process them, think about them, and evolve your opinion. Instead of deeply held beliefs, you end up with a superficial, self-justifying perspective that cares endlessly rather than thinking hard about what's really going on. I embrace the idea of seeking the truth. I love the construct of deeply rooted beliefs as a framework for it. I challenge everyone to think harder about what the truth really is, rather than clinging to your truth to justify your perspective. Remember, the truth is out there. Picture: boonchai wedmakawand / Moment / Getty Images One of the first things children learn at Sunday School is that it's a shame to tell a lie. It's true, but lies have a complicated history in the Bible. His famous figures, in fact, speak of falsehoods. One of the three principal patriarchs of Genesis, Jacob, lies to his father that he is Esau, his older brother, and steals his father's blessing in this way. Prostitute Rahab lies about protecting Joshua's spies in his home. The disciple Peter lies three times about the knowledge of Jesus - then he breaks down and cries when he realizes that Jesus had prophesied this very thing. The first two of these lies actually caused God's will. Jacob became the father of Israel's 12 tribes, and Rahab's deception allowed the Jews to reclaim Jericho from the pagans who occupied him. Lies that lead to God's will? Things get confused quickly in the study of the Bible! For our part, we're going to do the straightest thing: we're going to lie to each quiz, with every question -- but let's be honest. Your job is to separate the only false statement from two real ones. It could be a bit harder than you expect... a lot of people believe that things are in the Bible that they are not, or vice versa. (Our favorite was a person who insisted that all men are created equal was from the Bible.) You will need to have studied the Good Book a lot to get a perfect score on this quiz, or even close to one. Good luck! Our award-winning website offers reliable and easy-to-understand explanations of how the world works. From fun quizzes that bring joy to your day, addictive photography, and fascinating lists, HowStuffWorks Play offers something for everyone. Sometimes we explain how the stuff works, other times, we ask you, but we are always exploring in the name of fun! Because learning is fun, so stay with us! Playing quizzes is free! We send curiosity questions and personality tests every week in your inbox. By clicking Sign Up you accept our privacy policy and confirming that you are 13 years of age or older. Copyright © 2020 InfoSpace Holdings, LLC, a System1 company It's the universal question for everyone who's ever shared an apartment: how do I get my roommate to admit that they ate the remaining pizza I was saving in the fridge? A new study suggests that there is, in fact, a way to reduce the chances of someone lying. Researchers at the University of Tampere conducted a study on the effect of direct eye contact on lies, and found that there may be some truth to a typical human instinct. How can you get someone to tell the truth? Just look them in the eye, the study suggests. The Finnish study, published in the journal Consciousness and Cognition, tested the impact of eye contact on lies with the use of a two-player computer game. 51 participants between the ages of 19 and 37 took part in the game, and were directly instructed that they were allowed to lie during the game. They sat in front of a staged opponent they believed to be another participant, separated by a smart glass window that could change into opacity. The smart glass window became transparent before the participant made a move, allowing them to see their opponent. In the middle of the trials, the opponent looked directly at the participant's eyes; in the other half, they looked at their computer screen. The results? Participants who made eye contact with their opponents were less likely to lie in their later moves. This was the first study to demonstrate the effect by using actual eye contact with another person and measuring not any form of dishonesty, but lying, said study author Jonne Hietanen, a doctoral student at the University of Tampere. Hietanen warned against extrapolating too wild from the results, however, explaining: Since the results were obtained in an experimental situation, be careful not to draw conclusions too far away. It's a fairly common assumption that establishing direct eye contact with someone can help determine if they're lying. Psychology Today explains that most people think that aversion to the eye signals deception -- after all, embarrassment and shame can lead people to dodge eye contact. But here's the snag: the snag: who lie (that we are all, at some point) are also aware of the association between eye contact and truth. As a result, liars tend to make more eye contact with the target of their lie, in order to appear credible. A more effective way to determine if someone is lying? Evaluate their micro-expressions, explained Pamela Meyer, fraud reviewer at a 2011 TED Talk. These can include waving, making too much eye contact, freezing the top of the body, or displaying a fake smile. The study by the University of Tampere is remarkable, however, in that it goes beyond simply detecting a liar; rather, it suggests that the intended goal of a lie can actually affect whether someone is telling the truth or not. Maybe, then, there's no need to evaluate your roommate's micro-expressions while denying taking that pizza. Instead, a heavy dose of eye contact before asking them for the 80th time could do the trick. As artificial intelligence and machine learning permeate every aspect of our lives, machines are getting closer and closer to acquiring human-like language skills. Research has found that, without intention, business and morals... Education for all is the deepest and most productive response to income inequality. History has shown over and over again that education in reading, writing and mathematics is the great economic leveller for every human being...
