latest version of Adobe's design software, Photoshop CC is highly versatile and very powerful. Since becoming part of Creative Cloud, Photoshop has become the power player in the photo editing software game. However, the more large files you work with, the more bogged down you can get, particularly if you're using older hardware, slowing down your workflow to a crawl. So here are some practical and achievable ways to speed things up.01. Run Photoshop CC in 64-bit modeWhen you start Photoshop CC, you'll notice two options (depending on the version). One is Photoshop CC (64-bit); the other is Photoshop CC. The 32-bit version can only use between 1.7 and 3GB of RAM, while the 64-bit version can use the amount of RAM the computer will hold. So, depending on the machine you are using, choosing this option can help to greatly speed things up. Take advantage of RAM, go to Edit>Preferences>Performance. The Preferences dialog box shows the default preferences on my laptop. One of the first things you can notice is RAM is set to just 60%. This is pretty low. A good place to start is 70% and then test Photoshop to see how well it performs. You can increase this setting to 85%, but to make sure there are no memory errors. Otherwise, reduce the Memory Usage setting. In theory you should be able to use 100% of the RAM, but that is not practical due to other running applications (such as the font manager) that could trigger a memory error. The dialog box also provides history and cache settings. You can adjust the number of History states, although 20 is a good place to start. As for the cache, you will see two settings. The first, Cache Levels, adjusts how Photoshop redraws high-resolution images. If you have a large file, you can increase the cache levels to 8. If you are working with a smaller file, you can reduce it. And if you're using a drawing board, the Cache Levels setting can help with sensitivity and delay issues. The size of the cache pane regulates data processing. In Photoshop, large tiles and tiles increase photoshop speed with complex operations. Increasing cache size will help with operations such as batching files or large image processing.02. Tune your computerYe you want Photoshop to work quickly, you need to make sure your computer is in optimal shape. This means defragmenting hard drives, fixing disk errors, making sure you have enough RAM, shutting down unnecessary programs, and installing the latest Windows updates. Here are some good tools to have on your computer: Advanced System Care, MalwareBytes (anti-malware software), and CCleaner. Each of these programs offers benefits for system performance and I found that, with the exception of antivirus software, each program detects different problems on the hard drive. Turn off programsA other way to speed up your computer is to close unnecessary programs. Some of these programs run in the background during normal operation and can greatly slow down your computer. The fastest way to fix this problem is to turn off these programs at startup. To do this on Windows 7, click Start. In the previous parameter box, type 'msconfig'. The System Configuration dialog box opens. This box displays the name of the startup item on the left. Often, this description is enough to determine whether the item is needed to boot or not. Unchecking the item will prevent the program from running at startup. Sometimes, the element name is not enough to know what it is. If so, copy the name to Google and search. This will help you determine if the process is or if it can be deactivated. Once you're happy with the changes, click Apply, and then click OK. At this point, Windows will ask you to restart your computer or leave it late. When your computer restarts, you should notice a difference in performance.03. Using a drawing tabletA computer mouse or laptop trackpad can often be a really inefficient tool for using Photoshop, especially when it comes to masking or or Trying to paint or mask with a particular mouse can be like trying to paint with a baseball bat. So it's worth giving a drawing tablet a try – you'll be surprised at how much this can speed up your workflow. Note that with some tablets, such as those produced by Wacom, you might have stripes on both sides of the drawing space. If you accidentally tap one of those you may experience problems with unexpected zoom. The easiest way to deal with this problem is to disable those strips using the Wacom.04 interface. Create your own workspacesPhotoshop CC gives you the ability to quickly choose between different built-in workspaces. You can also create your own. To access workspaces, navigate to Window>Workspaces. In the menu on the left, you'll see your choices in the workspace: Essentials, 3D, Motion, Painting, Photography, and Typography.Clicking on one of them will display a default menu that you can use as a starting point. Alternatively, you can click New Workspace and design your own.05. Create your own shortcutsThe use of keyboard shortcuts is one of the most effective ways to speed up your workflow. The most commonly used keyboard shortcuts are Ctrl , A, Ctrl , C, and Ctrl , V (select all, copy, and paste). Of course, there are many others. Here's a list of Photoshop shortcuts to overload your workflow. Alternatively, you can create custom keyboard shortcuts. To do this, go to Window>Workspace>Keyboard Shortcuts &Menus.As you can see, there are many different ways to speed up Photoshop. Some involve the program directly, while others involve the operating system. As the various techniques apply, you will find their effect to be cumulative. One step may not make a big difference, but in combination their effect can be considerable. Words: Nathan SegalHow is this? Read these! These!
