Photo Florence IonThe Android 11 Beta was originally scheduled to run in tandem with Google's annual developer event, but the world had different plans for a software update this year. Despite the lack of fanfare, Google has now released the first public beta for Pixel users, leaving plenty of time to get the kinks developed before it drops for other Android devices later this year. If you're a game, you can opt into the Android beta program from your Google account right now. (Currently, only Pixel 2, 3, 3a and 4 users are eligible to participate.) Every beta version of Android is supposedly teasing that in the future. If you download the beta version of Android 11, you accept a contract for not-quite-perfect software and buggy performance with third-party apps. But in exchange, you'll be among the first to access new features like Android 11's updated shadow notifications, centralized power menus and more granular resolution controls. Where to start? Here's a quick step-by-step guide to our 13 favorite new features in Android 11. Notifications can be categorized into three different levels based on the app after app. Screenshot: Florence IonOn's previous versions of Android notifications will come through like a rush of water, with timely messages buried under less relevant app notifications. In Android 11, notifications for conversations can be categorized into three different levels, so the most important messages always slide at the top. Priority notifications will be displayed first, with regular alert notifications below them in the order in which they are received (but always under priority level). Silent notifications won't alert you at all. Instead, they will slide to the bottom of the shadow notification and wait for you to interact with them. Choose more specifically what notifications you want to see come through. Screenshot: Florence IonWhen you get a message notification, a long click to shuffle it into one of these three categories. In extreme situations, when, for example, there is a notification that will not be fired, a long press, and then click on the Settings icon to select the type of notifications allowed to pop through. This is also where you can eliminate notifications from this app, a period that can help reduce the noise coming through in the shadow of the notification. These categorization levels also apply to specific conversations in different messaging apps. (Remarkably, they're called Conversations in the Android 11 Settings panel.) For example, you can choose whether your favorite group text in Android Messages takes priority over the current theme with your closest relative on WhatsApp. Long click on the individual in the shadow of the notification to categorize it. If it is classified as a Priority, you will see a tiny unique icon indicator inhabited in the state bar when there is a new message in that particular thread. Bubbles will work similarly Facebook Messenger's Chat Heads feature. Gif: GoogleFor chatty among you, Android 11 introduces a universal chat bubble that any apps on your device can use if they implement this feature. (Only Facebook Messenger was big in the bubbles at the time of writing.) You can turn the bubbles on and off through the settings panel (apps and notifications of the zgt; notifications of the bubbles). Bubbles operate similarly to Messenger's original feature, Chat Heads, which has been a staple of the Android version of the app since its debut in 2015. As more messaging apps add compatibility, you will see circular avatars pop up on the screen, one next to the other, depending on the order they arrive. Bubbles make it easier to respond to a message without leaving the screen you're on. They are similar to the direct response feature presented in Android 10, which allowed you to respond directly in the shadow of the notification. If you like Facebook Messenger's chat chapters, you like Android 11's Bubbles.Android 11's media controls are built directly into the quick settings panel. Screenshot: Florence IonIn previous versions of Android, if you've been listening to music or casting a video on a nearby display, your media controls will show up inside the shadow of the notification. In Android 11, they have been moved up, so they are stacked next to quick settings. The result is a control-esque installation built directly at the top of the screen. Right now, you'll have to turn on the developer settings to activate these new media controls. You can do this by finding your phone's build number in the phone's Settings, and then repeatedly clicking on it until you see a pop-up countdown you to developer mode (about seven times). The device will pop up the final warning to let you know that you are a developer. Once this is on, scroll down to the Multimedia Options section of the developer (in the settings of the system) and click to enable a feature called Media resumption. Once you reboot the device, you'll see a widget-like version of media control pop up in the fast bar settings when you listen to music. It works for apps such as Spotify and YouTube TV, and even for watching videos through mobile websites. Drag down on quick settings to expand it for more options, including the ability to suck up media playback on a pair of headphones or another device. Android 11 allows you to choose a one-time resolution to access things like location data and camera usage. Screenshot: Florence IonCurrently, when you grant Android app access to permission, it's all or nothing: Permits either always available only when the app is in use or not at all. In Android 11, you can instead allow the app to access some part of your device only once, and it will have to ask over and over and over again if it wants permission to do whatever it wants to do. There will be different permissions Depending on how long you've been using your Android device. To access permissions manually, go to the Resolution Manager settings available under Apps notifications and in the Settings app. From there, click on each resolution to see which apps have access and then click on the app to edit it. This is a time-consuming process if you plan to go through each application. At the very least, Android 11 will warn you to revise permission settings for apps that you haven't opened in a long time. Screenshot: David MurphyYou may have seen Android 11's new auto-reboot permitting feature called zombie permits. It's the perfect way to describe how they work. Android automatically revokes app permissions after an indefinite inactivity time, somewhere between 60 and 90 days. Running the app during this time restores all the permissions granted, so this feature will only apply to those apps that have been dormant in the app drawer for several months. Then, when you go to run this app after a long break, it will ask you again to give it permission as needed. The updated Power menu gives you more than a simple button to turn off your phone. Photo: Florence IonAndroid 11 has a new power button menu and we love it. You pull it up by simply holding the power button on the side of your device. From there, turn off your phone, restart it, use Google Pay or even click through quick settings for your smart home devices. Better yet, you can customize every section of this new menu, albeit from different parts of the interface. You set up what's on the menu itself, through the Settings Panel (system zgt; Gestures power menu), and you can manage the default way to pay Google Pay through the Google Pay app. Smart home controls are the only feature you can directly oversee, and you can choose from them devices that you've already registered in the Google Home app. Camera feeds are also available from this screen, with preview videos directly embedded. When you share links, back up apps to the Share menu for faster access. Screenshot: Florence IonLink sharing villains will love the new Android 11 feature, which allows you to pin specific apps on the stock sheet. This gives you quick access to the most common apps that you can customize by long-clicking on the app in the Android Sharing dialogue and selecting the option to pin it down. Schedule Dark Mode so that it comes when it benefits you the most. Screenshot: Florence IonUsers rejoiced when the dark mode for the Dark mode helps save on battery life and also helps people with visual sensitivity. However, not all the benefits of dark mode at any hour, so Google also introduced planning in Android 11. To access to the feature, click on the display in the Settings app and then click on the dark theme. Here you can choose whether the mode works at all or schedule the preferred time. You can also choose to turn it on from sunset to sunrise or turn on at the usual time of your choice. New forms of Android 11 icons add diversity to the overall interface. Screenshot: Florence IonStock Android (or rather, a version of Google's operating system) does not allow you to change the icon based on the icon pack, but it allows you to play with different forms of icon. Android 11 introduces three new ones, bringing the total to seven different icon shapes. You can access the new icons from inside the display settings panel, under styles and wallpaper. Or, press the home screen for a long time and choose the last option. Click to change your style and navigate the carousel to select the font, icon style and interface color accent before choosing the shape of the icon. Screenshot: David MurphyPicture-in-picture video handy if you want to quickly Google something in response to the video you're watching or popping into another app for a quick response. However, if you're really trying to multitask, you may think you'd like more playback windows. In Android 11, you can click, hold and drag in the bottom left corner of the image window in the picture video to want it to size. You can make it as big or as small as you need in relation to what else you do on the screen. Android 11 will predict the apps you use the most on the home screen. Screenshot: You'll unload the beta version of Android 11 on your Pixel smartphone, you'll notice the dock periling apps at the bottom of the home screen. These are the apps offers and they are a new part of Android 11. Recommendations change when using the device throughout the day. You can press any of the icons for a long time to attach it to the prediction dock or go straight to the app settings. The app's offerings can be turned off in the Pixel Launcher settings menu by tapping the home screen for a long time and clicking on Home settings. Select offers and then tick off the option to include offers on the home screen. Screenshot: Florence IonScreenshots now require fewer editing taps in Android 11. Whenever you snap a screenshot while simultaneously holding the power button and the volume key down, you'll see a preview in the bottom left corner of the interface with a link to the editing. It's so simple that I cropped most of the screenshots you see in this article with this feature. Android 11 also has native screen recording abilities hidden in quick settings. Drag down on the notification shadow and press the editing button (it looks like a little pencil in the bottom left corner). Scroll down and then select the Option for the Recorder screen. Long To drag it up to the main panel of quick settings and make it active. Please note that the voice recorder will not work on the DRM video. Screenshot: David David has long been friendly to available users who rely on voice commands. But in Android 11, these voice control features are getting a significant upgrade. Specifically, Voice Access, which was launched more than four years ago, has been updated to make it easier for those who can't physically interact with the touchscreen display. In previous iterations, you had to know the number that corresponded to the item on the screen so that the voice command function knew what you were referring to. Android 11 is better contextualizing that on the screen. All you have to do is say the name of what you refer to, whether it's an app, action or item like a button or a link. This requires a bit of a learning curve for new users, but those who rely on it should have an easier navigation time interface than before. For a quick primer on the basic navigation command, Google has a useful support page.
