How to take screenshots on android tablet

Taking a screenshot of an Android phone screen can be a bit confusing, since the process is not the same on every device. Here are different ways to take a screenshot on Android. If you're running Ice Cream Sandwich (4.0) and aboveif you have a shiny new phone with an ice cream sandwich or above, screenshots are built right into your phone! Simply press the Volume Down and Power buttons at the same time, hold them for a second and your phone will take a screenshot. It will appear in your Gallery app for you to share with whoever you want! If you're running Android 2.3 and Below Fortified, Android 2.3 and Below has no screenshots built in. However, some devices (like many Samsung phones) have these features, but it varies from phone to phone. For example, on many Samsung phones, you can press home and power buttons at the same time to take a screenshot. Google around to see if your own phone has a built-in shortcut. If your phone doesn't have a built-in label, you'll need to use an app like No Root Screenshot It. You will need to install it on your phone and install its free companion app on your computer that will allow screenshots. You will have to plug the phone back into your computer every time you reboot it, but you will be able to take screenshots straight from the phone, which is great. If you're rooted and running Android 2.3 or belowif you've entrenched your phone, you have several options. You can install an app like Screenshot UX that will allow you to take screenshots through different shortcuts, or you could flash a custom ROM that has screenshots built in (like CyanogenMod). We love Android, but rooting your phone can give you the ability to do much more than yours... More there are more screenshot techniques than we could list here, but these are some of the easiest (if you're not rooted but know how to use ADB, you can get a screenshot from the command line, for example). Check your phone and see what it supports out of the box. Emailable Technical Support is a series of easy-to-use guides for the less tech-savvy people in your life. Is there a beginner technical support question you are constantly answering? Let us know tips@lifehacker.com. Remember that when you're just starting computing, there's very little that's too easy to learn. If you've ever wanted to share an image of what you see on your Android phone screen, the Simple Help blog goes through the process of getting a screenshot from your Windows computer. To take a screenshot, you'll need to turn on USB Debugging under the settings, install an Android software development kit, and then connect to the phone with a debugging tool. This process sounds long and painful, but in fact it's just a few steps, and the Simple Help guide will guide you through it easily, and the next time you want to share a screenshot with a friend, you'll be able to do so. Heath Heath for a full step-by-step, or check how GetPDAScreen makes screenshots of your Windows Mobile device. Windows Only: PocketPC app GetPDAScreen takes screenshots on your mobile device. There's no... Find out more How to take screenshots of your Android phone from Windows Simple Help there are many reasons to take a screenshot on your computer. Whether it's for a job or a personal project, sometimes you have to grab the information for later. We rely on screenshots almost on a daily basis here at android Authority, so we should be able to reach out if you need it. Here's our guide on how to screenshot on your PC. See also: How to take a screenshot on Chromebooks you can knock down most Windows tasks using one or two different methods, but there are actually six ways to capture screenshots in Windows 10. We will do our best to cover all of them, although we will lump several related options together. Ready? Start. Like a screenshot on PC:Options 1 and 2: Snip and Sketch and Snipping ToolOne are the easiest ways to take a screenshot on a PC with built-in software that Windows provides. Microsoft originally introduced Snipping Tool in Windows Vista, and it's been slowly phased in to Snip and Sketch from October 2018.Snip and SketchThere are several ways to move into Snip and Sketch. First, to open the program from the menu, either by searching it or keeping it in the taskbar. If you use one of these methods, here are the steps you need:1. Click on the blue button marked New.2. You can open the drop-off menu to cut off immediately, wait three seconds, or wait 10 seconds.3. Tap and drag the area you want to capture.4. Release the mouse and wait until the preview appears. Then save your piece. You can also bypass the first few steps, including opening the program by clicking on the Windows key. Just be careful to click all three otherwise Windows s S opens up the search function. Snipping ToolThe Snipping Tool is, in fact, the same as Snip and Sketch, right down to the message that the Snipping tool will soon fold into a new program. The procedure, like a screenshot on a PC, is usually the same list of steps:1. Choose mode as well as delay. You can cut off the square or round shape, and hold the fragment for up to five seconds. Click on the new button.3. Drag the mouse to cover the area you want to snip.4. Release the mouse to complete your snippet and then press the save button if you're happy with the result. Options 3 and 4: Printed screen and Windows key - Print ScreenIf opening software and dragging the mouse sounds like a headache, you can check the print screen button, often labeled as Prt Sc. This keyboard button captures the entire screen, although it does not save the file Here are the steps:1. Click Prt Sc. This will capture your entire screen.2. Open View program like paint. Then insert the image.3. Now you can save the file as usual. You can also install a print screen key to open the Snip and Sketch app, which should save some time. To do this, go to Settings and find the Easy Access menu. Then go to the Keyboard section and switch to use the Prt Sc button to open the Snip and sketch to further. If you hold the Windows key while you click Prt Sc, it will capture the entire screen and automatically save it in the Screenshot folder in your Pictures.Option 5: Game BarWhether you are in the middle of the game or not, Game Bar can be a handy screenshot tool. You can open the game bar by simply clicking the Windows key and the G key at the same time. Once opened, you have several options: Click on the screenshot button. Use the default windows key label - Alt and Prt Sc - to capture the entire screen. You can change the Game Bar settings in the settings menu and then go to the game bar. You will also have to activate the gaming bar, allowing it to record game clips, screenshots and broadcast through the game bar. Option 6: Windows Logo - Volume downAll the methods listed above are excellent for standard Windows 10 PCs, but what if you need a screenshot on Microsoft Surface Pro? Well, the software options will work just fine but you can also use a Windows logo that serves as a home button and push that down at the same time. The procedure is similar to the screenshot on most phones and tablets. There are times when you really need to share what's on the screen of your Android device. That's when Android screenshots come in handy. Screenshots are snapshots of what is currently being shown on a screen stored as an image. In this post we will show you how to take a screenshot on Android devices. We have included several methods, and some of them require little or no effort. How to take screenshots on Android devices:SonyHTC devicesLG devicesOnePlus devicesThird-party apps1. The standard way to take a screenshot of AndroidCapturing usually involves simultaneously pressing two buttons on your Android device; Usually the volume is down and the power buttons. Other devices may need to use a home-based power button combo. In addition, you can press and hold the power button for a few seconds; Select Screenshot from several options that appear. When you press the right button, your device's screen will flash, usually accompanied by the sound of the camera shutter. Sometimes a pop-up message or notification alert appears, indicating that a screenshot has been taken. Finally, any android device that comes with Google Assistant will allow you to take screenshots using teams alone. Just say OK, Google, and then take a screenshot. These basic methods should be all you need for most Android devices. However, there may be some exceptions. Android device device often include additional and unique ways of taking Android screenshots. For example, you can take a screenshot of the Galaxy Note series using S Pen. Other manufacturers have decided to completely replace the default method and use their own instead. How to take screenshots on Android: Samsung devicesA mentioned, there are some manufacturers and devices that have decided to go rogue and submit their own methods of shooting screenshots on Android. In some cases, these are alternatives that can be used in addition to the basic three methods discussed above. In other cases, they completely replace Android by default. You'll find most examples below. Read more: The best Samsung phones available todaySmartphones with Bixby digital assistantIf you have a later Samsung Galaxy flagship phone such as the Galaxy S20 or Galaxy Note 20, you have a digital assistant Bixby pre-installed. It can only be used to take a screenshot with a voice command. All you have to do is go to the screen where you want to take a screenshot, and if you have it configured correctly, just say: Hey Bixby. When the assistant starts working, just say take a screenshot and he'll do it. You can see the saved picture in your phone's Gallery app. If you don't have a Samsung phone configured to recognize the Hey Bixby command, just click and hold a special Bixby button on the side of the phone and then say: Take a screenshot to finish the process. S PenYou can use S Pen to take a screenshot, given that the device comes with one. Just pull out the S Pen and run Air Command (if it's not done automatically) and then select Screen to write. Usually, once the screenshot is captured, the image will be immediately open for editing. Just be sure to keep the edited screenshot afterwards. Palm swipeOn some Samsung phones, there is another way to take a screenshot. Go to the settings and then click on the advanced features. Scroll down to see the Palm Swipe To Capture option and switch it. To take a screenshot, simply place your hand vertically on the right or left edge of the smartphone screen and then swipe over the display. The screen should flash and you will see a notification that a screenshot has been taken. Here: These are the best cheap Samsung phones around Smart CaptureWhen Samsung has decided how to take screenshots on Android, it really went to all! Smart capture allows you to capture the entire web page, not just what's on the screen. Take a regular screenshot using any of the above methods, then select the scroll capture and continue clicking on it to scroll down the page. This effectively stitches up multiple images. Smart SelectSmart Select allows you to capture only certain parts of Facebook is on the screen, shoot oval-shaped screens or even create short GIFs from movies and and Smart Select by sliding the edge panel and then selecting the Smart Select option. Choose a form and select the area you want to capture. You may need to include this feature in your settings first, by ingining and display. How to take screenshots on Android: Xiaomi devices Xiaomi devices give you all the usual options when it comes to taking screenshots, and throwing in a few techniques of your own. Notifying several other Android skins, MIUI provides quick access to screenshots from the shadow of the notification. Just get off the top of the screen and find the screenshot option. Next: These are the best Xiaomi phones you can buy with three finger swipes from any screen, just swipe three fingers down the screen on the Xiaomi device and it will capture the screenshot. You can also go to settings and assign a number of different shortcuts if you prefer. These include a long-term home button or the use of other gestures.4 How to take screenshots on Android: HuaweiHuawei devices provide all the same default settings as most Android devices, but also allow you to take screenshots with knuckles! Turn on the option in the settings by switching to Motion Control and Smart Screenshot, and then disabling the option. Then just knock on the screen twice knuckles to capture the screen. You can also trim the shot as you like. Read more: Here are the best Huawei5 phones. How to take screenshots on Android: Motorola devicesMotorola devices are simple and clean. The company sticks to almost a stock of user interface, so you don't get that many options for taking a screenshot. Of course, you can use good ol' power and volume down to keep the trick.6. How to take screenshots on Android: Sony devicesOn Sony devices, you can find a screenshot of the option in the food menu. Just a long press power button, wait for the menu to appear, and select Take a screenshot to capture a screenshot of the current screen. This can be a useful method, especially when pushing combos of physical buttons hard. Here: These are the best Sony7 phones. How to take screenshots on Android: HTC devicesAgain, HTC will allow you to take screenshots using all normal methods. However, if the device supports Edge Sense, you'll also be able to use it. Simply go to the settings to change what makes the device's short or long compression by driving into Settings - Edge Sense - Set a short compression or set the compression and hold the action. More: A list of the best HTC phones you can buy8. How to take screenshots on Android: LG devicesWhile you can use the default methods to take screenshots on LG devices, there are also a few other options. Next: Here are the best LGKWuk memoYou phones can also take a screenshot with a quick memo that can instantly and allow you to doodle on screenshots. Just Switch a Fast Memo from from Shadows. Once the editing page is turned on, you'll see. Now you can write notes and doodles on the current screen. Tap the floppy disk icon to keep your work going. The Air MotionAnother option is to use Air Motion. It works with LG G8 Thin, LG Velvet, LG V60 Slim, and other devices. It includes the use of a built-in ToF camera (flight time) to recognize air gestures. Just wave your hand over the device until you see a badge showing that it has recognized the gesture. Then pinch the air, bringing your fingertips together and then pulling them apart again. Capture Not enough options for you? Another way to take screenshots on older devices, such as the LG G8, is to remove the notification bar and then touch the Capture icon. This will allow you to capture regular screenshots as well as extended screenshots. Then you will be able to annotate the screenshots as well. How to take screenshots on Android: OnePlus devicesY can hold the power and volume down buttons to take a screenshot on Android from OnePlus, but the company has another trick up your sleeve! More: The best onePlus phones in various categoriesUsing gesturesOnePlus phones can take a screenshot on Android by making three-finger swipes. The feature must be activated by disabling settings and gestures, quick gestures and a screenshot with three fingers and switching the function on.10. Third-party apps Not content with how to take screenshots on Android in a standard way? Then you can always try to install additional apps that will give you more features and functionality. Some good examples include Screenshot Easy, and Super Screenshot. These apps don't require root and will allow you to do things like record the screen and install a number of different triggers. You can even customize your own screenshot techniques using Tasker! See also: 5 best screenshot apps for AndroidHere are still a few tutorials to unlock the full potential of your Android device. Potential.
