epub .epub The Natural, the Artificial, and the Human being. Fair, Geyer, and Okun's book is an outstanding example of an engineering book written for an audience of professional engineers. The book begins with an introduction of how water is being used. After that, it goes into describing the essential components of a water system, including the watershed, treatment plants, storm water, and the distribution system. The major sections of the book are: Water Quantity and Quality Sources Water Distribution Systems Water Treatment Water Reuse and Treatment by Using Natural Resources One of the many outstanding characteristics of this book is that it goes into such details that the book becomes useful for the engineers who intend to plan and design a water system. This book would serve as a reference guide for the engineers who need to know the water quality, distribution systems, and the treatment plants. One of the many outstanding characteristics of this book is that it goes into such details that the book becomes useful for the engineers who intend to plan and design a water system. Introduction and Background Natural Water Systems Sources of Water Distribution Systems One of the most significant characteristics of this book is that it starts with the introduction of the natural world and the culture of the mankind. The book begins with a comparison between the natural and the artificial. One of the major mistakes that the author made in the book is not to distinguish the man-made system from the natural system. The man-made system and the natural system are not equal. It is because the engineers are not able to understand the difference between the two. In the case of this book, the author mentions that the natural system has many advantages such as low cost, high capacity, and availability in large amount. If the natural system and the man-made system are treated as equal, then many new projects cannot be built because the cost of natural system is low. The author claims that if the natural and man-made systems are treated as equal, then the natural systems cannot compete with the man-made system. The author claims that the natural system is built from nature, but the man-made system is built by man, which results in many problems such as aesthetic and environmental problems. Other than the natural and the artificial systems, the 520fdb1ae7
