Kaggle is a community-based data science competition, providing free data to challenge new entrants in the field. I wish to use a Kaggle notebook for a simple statistical analysis. I downloaded two scripts from the Kaggle website and compiled them but I cannot use them. They look like this: import pandas as pd import numpy as np Also I created a data set from the downloaded Kaggle notebook file. Now I want to read the data into a DataFrame. file_path = "F:/Users/Fujitsu/Desktop/R/RInProgress/Supercomputing/kaggle_code/kaggle_code.ipynb" data = pd.read_csv(file_path, header=None) But I got the error: TypeError: read_csv() argument must be str, not bytes Please let me know how to use these scripts. A: Here is the code I would use: data = pd.read_csv(file_path, sep=' ', header=0, engine='python') Using sep=' ' and header=0 allows you to read the file into a dataframe. Edit: To replace the nans data.replace('nan', 0, inplace=True) I don't know

why it doesn't just remove them for you. United States Court of Appeals Fifth Circuit 520fdb1ae7
