A captivating new series. --- The Oak Creek Trilogy The Silvery Sword The Dark Sky The Cask of Black Powder The Oak Creek Trilogy is the first three books in a trilogy featuring the character Emily Parker. A journey into a past that has stayed with her, the books tell of her life as a child, of her budding romance with her first love, and of the life she leads with him. A coarse-grained model for a double-stranded nucleic acid helix based on base-pairing potentials, electrostatic interactions, bond torsional flexibility, and Lennard-Jones interactions has been developed and tested for self-assembled helices. By solving the equivalent of the classical three-dimensional problem of motion in a potential field, the model describes the conformational dynamics and topology of a double helix. A summary of its basic features is given, including the time scales for folding and melting, and the equilibrium values for various structural parameters. The model is further compared with existing coarse-grained models and with experimental data on the dimensions and structural parameters of double-stranded DNA molecules. The model is found to exhibit the desired degree of conformational dynamics, and thus is used to elucidate the interplay between conformational dynamics and base-pairing selectivity. We show that the general features of helix selfassembly are determined by the sequence and electrostatic interactions, and that nucleotide flexibility, in particular the reduced lability of the base-pairs, helps to stabilize the double helix. The model presented here gives a complete picture of the relative importance of each interaction term in the formation of double helices.
