Komodo Dragon Longer m, with extremely sharp claws, huge teeth and a poisonous bite... While it may sound like something out of a horror movie, it's actually a description of the description Komodo Dragon. These reptiles are real and they are one of nature's most incredible creatures. Komodo dragons have lived on some Indonesian islands for thousands of years. One story tells that the Komodo dragon was first discovered during World War I (World War I), when the plane crash-landed in the waters around the islands. The story tells how the pilot swam to the island of Komodo, where he was surrounded by terrible, huge lizards. It sounds like something out of action, but the story is actually a myth. We don't know exactly when the Komodo Dragons were first discovered, but the earliest stories come between 1910 and 1912. The existence of the Komodo dragon was confirmed in 1926. This year, explorer W. Douglas Burden led an expedition to Komodo. He worked at the American Museum of Natural History. He returned from his journey with twelve dead specimens and two living Komodo dragons. The Komodo Dragon is the largest living lizard in the world. Some Komodo dragons can be 3 m long and can weigh more than 130 kg. This means that Komodo dragons are the heaviest lizards on Earth. They have long heads with short snouts, scaly skin, short legs and large, strong tails. The largest dragon ever found was 3.13m long and weighed 166kg! Komodo dragons are the main predators on the islands where they live. They will eat almost everything, including carrion, smaller dragons, wild horses and pigs, great water intermediate english reading and comprehension book pdf
