for mac TDL.SYS is a file which doesn't run in the background and is used to keep track of the installation of programs. The Microsoft website even explains that the file is used "to store and update files needed for programs that are installed on the computer. Once you have the system file MDT\_Backup\_MYS\_2012.PST in hand, run the following commands to transfer it to a temporary file: `sudo mv MDT_Backup_MYS_2012.PST /home/backup/` This will place the .PST file in the /home/backup directory. The command above will find the file in the /mnt/TEMP directory, which is the default location for TEMP. Make sure you understand where the file will be saved, because you might run into issues if it goes wrong. While this process is running, you might want to check the security of your system. Check the file and folder permissions to ensure that only the

---

required user has access to the file. Use the following command to change the permissions: `sudo chmod 777 /mnt/TEMP` This allows everyone to read and write the contents of the file. This will need to be changed back after the transfer is complete. You will need to download this update as an offline installer. The reason for this is that the update cannot be downloaded and installed while the server is connected to the internet. If you do try to use the CD, you will probably find that it doesn't work. Instead, you can use the `MDT_Backup_MYS_2012_2010.wim` file that you downloaded from the Microsoft website. All Rights Reserved. Set the Permissions To use MDT Backup, you need to make sure that you are logged into the server as the built-in Administrator user. If you are logged into the server as a different user, you need to grant the Administrators group write access to the CD drive. To do this, you can use the command below: `sudo chmod 775 /mnt/CD` This command will change the permissions to the `/mnt/CD` drive to `775` (read and execute and write permissions for the built-in Administrator user). To make this change permanent, you need to reboot the server, and log back in with the built-in Administrator user. You can do this with the following command: `reboot`. Once the `520fdb1ae7`
