The complete penny stock course pdf

September 2, 2015 5 min read The Opinions Expressed by Entrepreneur Contributors are their own. I hear it all the time: Tim, I want to know stock trading, but I don't have the money. What can I do? And the people who ask me to forget about it are that I was once where they are. I didn't have a mentor, and I didn't have a special training program to help me uncover the trading patterns that made me successful. Related: Don't make these 2 mistakes with cash on HandI worked hard and I did it on a budget. Here are three ways to do the same:1. Use free resources. There are so many great instruction videos, blogs and other resources to help you get started that you have absolutely no excuses for not jumping today. I have over 100 hours of videos on my Youtube channel EHAE - all free for you at absolutely zero price. Can you imagine where you would be as a trader if you took the time to go through all these videos? Let's say you took two hours a day to study my stock trading tips. You get through the video under two months and I guarantee you would be in a better position than the people out there who buy in big ticket courses and then never act on the information they purchased. I wanted to show you all the hours that I spent when I first started sitting at the computer and studying stock cards until my eyes glazed. I started with a square one, too - and I didn't have access to nearly as many resources as you. Fifteen years ago, the Internet was a completely different place. If I could implement this with my limited access, you can do much better now, with all the different resources out there today. Set up a hands-on account. With all the different free resources, I want you to go crazy. Read every blog or book you can get your hands on and watch every video. Learn about the basics of stock trading, what it means to watch price action and how to execute trades. But I also want to warn you that there is a point where you have to translate all that education you have invested in the action. Reading about trade is not enough. You're not a trader until you' . . . Trade. If you don't have the money to open your first brokerage account, at least start practicing. Find a website online that allows you to set up account practices and actually execute multiple test trades. I practice the strategies I teach, but I do it with low risk. While practice portfolios are not ideal mirrors of real accounts, they are at least you are used to the feeling of researching and executing trading. Related: Are investment advisers worth it?3 Start saving on your brokerage account as you research and run trades in your practice accounts, at brokers I use because I want you to think ahead in the future. One of the great greats About penny-trading stocks is that you can get started with a small account. Let's say you only have $2,000 to invest. With this money, you can buy about 16 Apple shares at a price of $120 per share, or you can buy 2,000 shares traded at $1 per share. And since you make money when you enter and/or exit stocks based on the number of shares you hold, which of these options do you think will help grow your account faster? Penny stocks are great for beginners, but I want to warn you of one thing: Don't use the last $2,000 to open your brokerage account. Set it up with money that you can afford to lose. If you don't have a few hundred dollars or a few thousand you feel thus, cut your expenses or earn a little extra pocket change until you do. When you are ready to start an active trade, find a mentor who will help you make the most of the money that you were able to save. While it's not always free, the amount you save without making stupid mistakes and avoiding unnecessary losses will help start you on the right foot to long-term profitability. If you started investing in a meager budget, what other tips would you add to this list? Leave a comment below with your suggestions. Related: 13 Reasons Why Your 401 (k) Is Your Risky Investment More about this cheap stock and how its high risk nature, big bets ask spreads and lack of liquidity may not make it the wisest investment. It's a funny thing about penny stocks - people will invest in them even if they suspect that the share price is being manipulated, according to a recent study by the National Bureau of Economic Research. What's the attraction? By definition, penny stocks, also called micro-caps, don't cost much (up to $5 per share), and investors are attracted to the notion of turning $1 into $2 and getting 100 percent (or more) returns on the dollar. After all, it's easier to double your money on $1 a share than $10 a share, right? But that's really not the case in most penny stock trading experiences. The chances are actually higher, you will lose more money than profit from a penny stock investment. First, a few facts about penny stocks, and then quickly dive into whether investors can actually find a good profit potential of penny stocks: Penny stocks are usually over-the-counter, either over-the-counter board bulletin or over-the-counter, and, more frequently, on the NASDA's and U.S. stock exchanges.Penny stocks can be traded on other securities exchanges, primarily on overseas stock markets. Penny stocks are usually associated with young companies with low cash reserves and little or no track record. Penny's shares can also be identified as privately held securities blocked from public trade. Penny stocks are generally not traded frequently, making them less liquid for owners. Penny stocks are highly speculative speculative it is often difficult to assess accurately. The U.S. Securities and Exchange Commission has strict rules on penny stock trading, including written documents from dealer brokers about the higher relative risk of investing in penny stocks. Give high risk and low liquidity a penny of stocks, can investors actually reveal some winners in the sector? The answer is shaky yes, and only if you follow the following guidelines: Focus on Profits: Target Penny Stocks, which have steady earnings growth and that trading is close to its 52-week high. Don't trust Penny Stock Newsletters: Often, penny stock investors turn to penny stock newsletters for good recommendations. However, just as often, these newsletters are unreliable and actually own stocks in the same penny of stock they advertise. If you check penny stock newsletters, make sure you read the reveal notice included inside (mandatory SEC inclusion). Disclosure notices can provide any conflict of interest on the part of the newsletter provider. The goal of penny stocks with heavier trading volume: the more penny stock trades, the more reliable it is. That's why it's important to focus on penny stocks that offer high volume trading (goal of penny stocks that traded more than 100,000 shares during the trading session.) Abide By More than .50 cents per share Rule: Another good rule of thumb - only trading penny stocks with a price of more than 0.50 cents per share. Stocks that are traded at a lower price tend to be highly speculative and include companies with no notable track record of success. Only buy Penny Stocks companies that make money: This may seem obvious, but with penny stocks, don't leave a stone unturned in your research. Hence, check the financial companies before buying a penny of shares. If there is documentary evidence that a company makes a profit, the odds are lower than losing money to buy a penny of shares. Don't Buy Penny Fund It's Talked Up: Penny Stock Market is littered with broken dreams, and drained bank accounts, investors who purchased shares based on an expert opinion that the share price will eventually soar. Penny stocks are notorious for having existing shareholders who often present themselves as objective investment experts to advertise or say stocks artificially inflate their price. Don't fall in love with this scam. Stick to the company's financial statements and its records of making money and paying the bills. These are the key indicators that penny stocks can offer financial opportunities to investors. Be patient: Once you identify a penny stock that offers potential benefits, don't buy it right away. Instead of track stocks for a week or so and monitor how it trades, especially targeting frequency trades (trading volume), volatile stock price fluctuations, and knowing the best price entry before pulling pulling To buy. Be practical: With penny stocks, the odds of losing 25 percent or more of your investment are stronger than earning that rate of return. Hence, if your penny stock investment ticks significantly up, count your blessings and sell on the upside - this is probably your best chance to make a profit on a penny of stock. Overall, know that the odds of finding a good, solid penny stock that rewards you with a profit against you. However, finding a diamond in the rough is not impossible if you stick to the tips and principles listed above - and on a regular basis. Otherwise, don't worry with penny stocks if you have the money to burn. There are two types of inventory analysis: fundamental and technical. The first is about finding the activities of the company itself (management, income, debts, contracts, lawsuits, etc.). The latter includes the search for patterns on the investment chart, as well as clues to the thinking of investors that can be obtained from them. There are advantages to using technical analysis (TA) on penny stocks, but you will find that with low stock prices there are some limitations and risks. When investments or the market are observed over time, trends can be identified. Charts, graphs and statistics based on these observations are used in technical analysis (TA). TA is an attempt to identify these trends that are labeled up, down or sideways. The upward trend is usually a constant increase in prices in the market or investment. Conversely, the downward trend is a constant decline in prices. The side trend indicates that supply and demand are relatively equal, without identifying any change in price trends. This is seen as a typically horizontal straight line on the schedule. Moving average is the average price for these investments calculated every day. As prices change daily, the average will change (so the term move, it moves through the timeline). This leads to a more accurate picture of the average investment price than the simple average price for a given period. The level of support is a sufficient market requirement to ensure that the investment price does not fall. Against the level of support is the resistance level, the highest price at which prices can rise no more. Market sentiment (thoughts and feelings of investors that affect demand - in turn, it affects pricing) and then causes a breakout or breakdown of prices. Breakthrough is when the price trend breaks through the resistance line, and the breakdown - when the price trend breaks through the support line. Once you've identified the investments you want to look at, try finding a performance chart or data to make the chart yourself. When scheduling or analyzed stocks over time, use a spreadsheet or financial program to help you determine the trend line if I don't know how to calculate it yourself. You'll be able to spot the pros or cons pretty quickly, since they are simply pointed at the graphic lines, usually trending up or down. To detect resistance and support lines, connect the highest peaks along with straight lines and the lowest gutters together. Gold futures 1-minute chart with little and basic support and resistance. MT4 When you do this, you'll see resistance lines and support levels, and you'll be able to determine when an investment makes its way through one of them. After determining your resistance and support level, look for and observe the amount of trade for the investments you have chosen. When prices and volumes increase or decrease together, this is likely to be a trend. If they are opposite in relation to each other, then on the horizon there may be a reversal. There are some models that have been identified that seem to be more reliable when it comes to low-volume shares of penny stocks: Bottom out pattern: This type of pattern emerges after a long, steady slide in the share price. The trend goes from down for a few months to the side (usually within a few weeks). When this coincides with a sudden increase in trading volume, stocks may be about to enter a long, sustained price recovery. Often, stocks that display the bottom of the template will be some of the best long-term holds. Price Failures: The way some investors play (and benefit from) falling prices should be in the right place at the right time. Try to keep the order to buy at a finely traded penny stock well below the recent or current price. You can catch any stocks that fall through the cracks. Topping pattern: It looks like (only backwards) to the bottom of the template. Stocks have climbed for a long time and now appear to be leveling off, or trading sideways. If this seems to coincide with a decline in daily trading volume, investors are going to start selling and prices will start to fall. Consolidation of shares: When the shareholder base flips over, it can be very good for the price of a penny of shares. Simply put, new owners tend to have positive expectations for the investment they have just bought, and are much less likely to sell soon. When the share price is trading sideways at a higher than average volume, it may be a display of a picture of a possible higher price. Candlestick Chart Patterns: Unlike more common line charts, or open-high low closing (OHLC) trading schedules, some models show that the trend of penny stocks is about to reverse, or that prices may fall (or rise) in the coming weeks and days. Some popular candlestick models dark cloud cover, exterior reversal of the picture, Doji, Harami, piercings, hammers. Gapping Stocks: When stocks open higher (or lower) than where they traded the day before, it's known as gaping. For example, if a penny of stock shares At $1.50 and then reopening the next day at $1.95, it represents a gap of 45 cents. Against the trend: This picture plays well with penny stocks in particular, demonstrating the positive effects of investments holding under pressure. When markets fall significantly, stocks that hold the best in price are usually the ones that get the most once the market recovers. Basically, some ideas to keep in mind: TA is best used in conjunction with high-quality companies that are already discovered with fundamental analysis that don't work when stocks have low trading volume (the more activity, the more reliable the pattern) IS usually not a factor in the company's foundations can be a good tool for determining potential price movements in penny stocks Remember that relying solely on technical analysis is not a quick wealth method. You should understand that this can often be misleading. You can see what you think is the perfect topping out of the pattern only to watch the stocks continue their ascent higher. There is no strategy that is fool-proof. This is why it is so important to start by trading paper (without money) as you learn and develop your own approach to penny profits stocks. Start slowly and you'll finish well before investors who dive in, wallet first.
