When using a computer With a trackpad or touchpad, you may find the screen cursor is unresponsive or erratic in its movements. According to Dell's support, problems with the trackpad may be caused by various problems, including faulty device drivers, incorrectly adjusted trackpad settings, or a dirty trackpad. You will have to explore each of these issues to solve the Dell trackpad problems. A number of problems with the Dell trackpad are caused by incomplete or faulty drivers. To check if the Dell trackpad driver is installed, click Start or Windows orb when using Windows Vista and Windows 7. Click the right button on my computer when using XP. Tap the right computer button when using Vista or Windows 7. Click the Properties button. Click on the Hardware tab in Windows XP or click on the Device Manager button in Vista and Windows 7. In the window that appears, click the I icon next to the Mouse record and other pointing devices. The Dell trackpad driver will be listed as a Touchpad driver or trackpad, probably made by Synaptics, the developer of these devices. If there's a driver's entry! or the x icon next to it, you will need to remove and reinstall the driver. If these icons are not available, the drivers of your trackpad are installed properly. If Dell trackpad drivers aren't installed properly, as indicated in the Check Dell Trackpad drivers section, click the right button on the driver record and click delete. Although, nothing forgets about errors and problems in the windows. The errors and malfunctions of the touchpad are universal in nature; they experience at least once every laptop user, regardless of their laptop brand and operating system version. However, recently, touch panel issues have been reported to a greater extent by users of Dell laptops. While we have a separate and more comprehensive guide on how to fix a touchpad that doesn't work with a list of 8 different solutions in this article, we'll go for techniques to fix the touchpad in Dell laptops in particular. The reasons for not running the touchpad of the Dell laptop can be traced down to two reasons. First, the touchpad may be accidentally disconnected by the user, or, secondly, the touchpad drivers are out of date or damaged. The touchpad problems first arise after a wrong Windows software update, and sometimes out of nowhere. Fortunately, fixing the touchpad, and therefore getting its functionality back is pretty simple. Below are a few methods to fix your Dell Touchpad not working issue. 7 ways to fix the Dell Touchpad doesn't work Make sure to create a recovery point just in case something goes wrong. As mentioned earlier, there are only two reasons why your touchpad can't respond to benign touch. We'll fix both of them, one by one, and try to revive your touchpad. We'll start by ensuring that the touchpad is really turned on, and if it's not, we'll switch it to through the control panel or Windows settings. If the touchpad functionality is still not coming back, we'll move on to failing to install current touchpad drivers and replace them with the most updated drivers available to your laptop. Method 1: Use keyboard combination to enable Touchpad Each laptop has a hotkey combination to quickly turn on and disable the touchpad. The key combination comes in handy when the user connects the outside mouse and doesn't want a conflict between the two pointing devices. It is also especially useful to quickly turn off the touchpad while trying to prevent any accidental palm touching. Hotkey is usually marked with a rectangle with two smaller squares on the bottom half and a slant line running through it. Typically, the key is the Fn and F9 in Dell computers, but it can be any of the F-numbered keys. So look around for the same (or perform a quick Google search for your Laptop model) and then simultaneously tap the Fn and touchpad on/off the key to the touchpad. If the above doesn't fix the problem, then you need to double tap on TouchPad to turn the indicator on/off, as shown in the picture below to turn off the Touchpad Touchpad light Turn on the Touch Panel. Method 2: Turn Touchpad through the control panel in addition to the hotkey combination, the touchpad can be turned on or off from the control panel too. Many Dell users who encountered touchpad problems after the Windows update reported that the inclusion of the touchpad from the dashboard solved their problem. To turn on the touchpad from the control panel, follow the steps below- 1. Click Windows and R on the keyboard to open the launch team. Type control or control panel and hit to enter. (Also, click on the start button, search the control bar and click on the open) 2. In the control panel window, click on the hardware and sound, followed by the mouse and touchpad. 3. Under the mouse and touchpad, click on the additional mouse settings present at the bottom or right of the screen) 4. A window called Mouse Properties will open. Switch to the Dell touchpad tab and check to see if the touchpad is on or not. (If you say you don't have a tab, click on the ELAN tab or device settings and under your devices, look for a touchpad) 5. If the touchpad is off, just click on the switch to turn it back on. If you don't find the switch, re-open the start-up command, enter main.cpl and click type. Switch to the dell touchpad if you're not there yet and click to change the Dell Touchpad settings Finally, click on Touchpad to turn on/off the switch and switch it to ON. Click on the save and get out. Check to see if the touchpad functionality is returning. Method 3: Turn on the touchpad from Settings 1. Click Windows - I'll choose the device. 2. From the left menu, choose Touchpad. 3. Then make sure to turn the switch under the Touchpad. 4. Reboot your computer to save the changes. Click the right button on other mouse devices (except the touchpad) and select Uninstall. 4. If he asks for confirmation, choose Yes. 5. Reboot your computer to save changes. The second cause of the touchpad failures is damaged or outdated device drivers. Drivers are computer programs/software that help the hardware system communicate effectively with the operating system. Equipment manufacturers often roll out new and updated drivers to catch up with OS updates. It is important that your drivers are aware of the latest version to make the most of the connected hardware and not to face any problems. You can either manually update touchpad drivers through your device manager, or use third-party apps to update all drivers at the same time. The first is explained by this method. 1. We start by launching a device manager. There are several methods to do this and we have listed a few below. Follow which feels most comfortable. a. Click Windows and R to start the launch team. In the launch team's text box, go to devmgmt.msc and click on OK. b. Click on the Windows start button (or press Windows + S), enter the device manager, and click Enter when the search results return. c. Open control panel using steps explained in the previous method and click on the device manager. d. Click Windows X or tap the start button and select the device manager. 2. In the device manager's window, expand the mouse and other pointing devices by clicking on the arrow next to it or clicking twice on the label. 3. Click the right button on Dell Touchpad and select Properties. 4. Switch to the Dell Touchpad Properties Window Driver tab. 5. Click on the Uninstall Driver button to remove any damaged or outdated driver software that you may be running. 6. Now click the Driver update button. 7. In the next window, select the search automatically for the updated driver software. You can also manually download the latest and most updated drivers for the Dell touchpad through the Dell website. To download touchpad drivers manually: 1. Open your preferred web browser and look for 'Dell Laptop Model Driver Download'. Don't forget to replace your laptop model with your laptop model. 2. Click on the first link to visit the official driver download page. 3. Type of touchpad in the text box under the keyword. Also, click on the drop-off menu under the operating system label and select the OS, system architecture. 4. Finally, hit Next and Download. You can also check the version number and updated drivers date by clicking on the arrow next to the download date. Once downloaded, retrieve the file with a built-in Windows retrieval tool or WinRAR7-zip. 5. Follow steps 1-6 of the earlier method and this time select my computer for the driver driver 6. Click on the View button and find the downloaded folder. Hit Next and follow the instructions on the screen to install the latest touchpad drivers. In addition, you can also install drivers by simply clicking on the .exe file and following the hints on the screen. You can also automatically update touchpad drivers with the side of the app. Sometimes you can't find the right driver for a specific laptop model. If that's the case for you or you just don't want to go through the hassle of manually updating drivers, consider using apps such as Driver Booster or Driver Easy. Both have a free as well as a paid version and increase the long list of features. Recommended: If you still have a touchpad problem, you need to take your laptop to the service center, where they will make a thorough diagnosis of your touchpad. This can be physical damage to the touchpad that needs repair damage. The above methods, however, will help you solve software problems by causing the Dell touchpad to not work.
