.357 ammunition is used -- gained popularity. Many gun owners purchased them to protect their home and property, or to add self-defense to their .22 rifles. Others who wanted to be around large animals acquired them to shoot deer and to hunt coyotes and other varmints. From 1979 through 1982, sales of the magazines exceeded a million. In 1982, a federal tax was imposed on the magazines, though some of them were already taxed at the state level. This increased their price and prevented the purchase of 100-round magazines from existing retailers. In 1984, a similar tax was imposed on the magazines. This caused many .357 advocates to seek out .22 rifles to shoot small game such as squirrels, rabbits and birds. To counteract this trend, the .357 Magnum was modified to make it easier to shoot smaller game by increasing the muzzle velocity of the bullet. On September 11, 1985, the .357 Magnum was declared the Federal Wildcat of the United States and became officially the .357 SIG. This was done in a ceremony at the G-5 Industries plant in Holley, Mississippi. When the .357 SIG went into production, there were already .45 and .44 Magnum revolvers on the market. These were called the .357X Magnum. The goal of the .357 SIG was to be a "true .357 Magnum" which could handle both big and small game. The new weapon was first sold to law enforcement in 1985 and to the public in 1986. In 1991, the .357 SIG became the standard sidearm of most law enforcement agencies in the United States. In 2014, the .357 SIG was the only cartridge among .44, .45, .38 Special, .44 Special, 9mm, .357, and .44 Magnum that is still produced in the United States. References Category: Pistol and rifle cartridges A major type of non-volatile memory is the flash memory. This is popular because of its high memory density, and its rugged mechanical properties. Flash memory is commonly used for portable devices such as cell phones, digital cameras, and pen drives. One type of flash memory is a "NAND" flash memory. NAND flash memory has the advantageous of high speed and high reliability. A flash memory is an integrated circuit (IC) comprising a number 520fdb1ae7
