Many people believe that they should program the garage door opener on the HomeLink system that came with their car. Maybe you bought a car used and don't have a guide, or you have a guide, but it's hard to follow. Either way, it's not hard to program a garage door opener. This should take no more than 5-10 minutes if you are keeping a close eye on each step. Having an assistant will make the process go even faster. The receiver, portable transmitter and transmitter in the car must be in good operating condition to ensure success with the garage door opener program. The HomeLink system is available on a wide range of vehicles and can also be purchased as an aftermarket product. It is compatible with almost all garage door opening systems, including Liftmaster, Chamberlain, Craftsman, Genie, Overhead Door, Allstar and Wayne Dalton. The main requirement is that the garage door opener works at 288-433 MHz. You should be able to find the frequency of your device on the back of the portable transmitter. To program the opening of the garage door, you will need to lift and lower the door. So to keep the process safe, make sure that children and pets stay away from the garage. Once you're ready to start, follow these steps: Always start with a new battery in a portable transmitter. If you're not sure how old the battery is, go ahead and replace it. Turn the key to the accessory position (ACC) before you start programming the garage door opener. For the first programming (or if you think the garage door opener was previously programmed), press two external buttons on the transmitter for 20 seconds until the light starts flashing. On the transmitter, hold the button to be programmed down until it starts flashing slowly (20-30 seconds). Hold the button down for the next step. Grab the portable transmitter in the other hand and put it on the flashing light from about two inches. Click the work button on the portable block. As soon as the light starts flashing faster, the frequency was entered into the HomeLink transmitter. Release both buttons. This step is easiest with an assistant. You will need a ladder and, quite possibly, a flashlight. On the receiver opening the garage door (i.e. the engine located inside the garage), press the learning button (also called the smart or learn button). The button may not be tagged, but it will have a small light next to it that flashes when you press a button. (Note, if the light remains on continuously, the programming is complete, and the garage door opener should function.) If the light flashes (or if it flashes briefly before it becomes continuously lit), you have 30 seconds to take the next step (which is why this goes faster with the assistant). machine, with the key still turned to the ACC, click you programmed on the transmitter in the car for three seconds. Remove your finger from the button, then press for another three seconds. If the garage door has not yet moved, press the button for another three seconds. Once the door moves, the garage door opener has been programmed. If the garage door opener doesn't seem to respond to the programming effort, then turn off the receiver for a minute and then try again. Make sure your new battery in the portable transmitter is installed correctly. If you still can't properly program the garage door opener, call HomeLink Customer Service (1-800-355-3515). If problems persist, you may need to purchase a new garage door opener. Opener. chamberlain clicker universal wireless keypad garage door opener programming instructions
