[W]e have taken the opportunity to substantially revise the text so as to make it more relevant to the changing needs of the field. (the... is from p. 24.) So: Is the "system" from which we are receiving "signals" not the same "system" from which we are receiving a "bunch of signals"? If the answer is Yes, then why is it used? Is it just an error in terminology? A: In this sense, "signal" and "system" are synonymous, a signal is a communication from some internal part of a system to some external part, and a system is an aggregation of many subsystems. When a signal can be represented as a system, then this is called a system-signal or system-artefact. In the illustration below, the system is a room in which people and other objects reside and exchange signals with each other. The black dashed rectangle encloses the room, and the red dashed rectangle encloses one of the people. The human is talking into a microphone, the microphone is producing a signal, and the signal is showing up on the screen. It is

perfectly appropriate to say that this signal "comes from the human". The human is an artifact, and the signal is a communication from the human to the microphone. The human is not a "system", the room is a "system", and the room itself and the people in it are "signals". When a signal cannot be represented as a system, then the signal is an artifact. For example, the black rectangle in the above diagram is not a "system", it is just a boring wall. The people in the room are not artifacts, their movements and speech are signals. @import '../styles/themes'; @import '../styles/mixins'; .admin-ui { position: fixed; height: 100%; width: 100%; z-index: 1000; top: 0; left: 0; right: 0; bottom: 0; overflow: hidden; background-color: \$white; .admin-tool { position: absolute; top: 50px; right: -50px; bottom: 0; 520fdb1ae7
