The ever-changing landscape of mobile technology is busy with new companies with flagship devices undergoing constant testing of dominance, and many competitors are trying to further push the standard of what makes a great phone. For this reason, even devices built to industry standards are quickly used, abused, and discarded, left to join the ranks of forgotten phones of yesteryear. Some devices, however, have gone, but have not forgotten - and continue to be relevant in our minds. These are devices that we found to be truly iconic. Get ready to travel down memory lane as we mention the devices that have really managed to capture our attention, are fixated in our hearts and minds, and have forever left their mark in the frenzied world of mobile technology as we know it. Apple iPhone (1st generation) Including the first generation Apple iPhone on our list was almost mandatory. While this was not the first touchscreen mobile phone to appear on the market, it is certainly the first to become a household name. Thanks to smart marketing and thoughtful design, the first Apple phone became a hit. A 2007 U.S. study found that 6 out of 10 consumers were aware of the existence of the iPhone before it hit the market. A few months after the release of the iPhone in the U.S., Apple came out on the world of joy with the device, and by the time their second smartphone released (iPhone 3G), the original iPhone was sold more than 6 million units. Fast forward almost 10 years, and the term iPhone is part of the global vocabulary. BlackBerry Curve 8300In late 2007, RIM decided to expand them achieved beyond their widely successful business class devices and foray into the high-end consumer market. The result was the Curve series, primarily the Curve 8300. This portable was loaded with features that were attractive to electricity consumers and the media alike. The Curve line carried RIM's own pearl trackball from the smaller Pearl Series. The LED flash VGA camera was also standard on the device, and using the Roxio desktop program, users were able to download the high-quality MP3s curve.The heavy integration of consumer-in-demand media features did not limit BlackBerry's powerful communication attributes, however. Email, web browsing, and host of other productivity features that made the BlackBerry stand out is still very much a part of this device. The Curve 8300 has been billed as the best blackberries of its time, and really set the standard for powerful devices that have appealed to all niche users. Google Nexus 5Okay, so we know Google didn't actually produce this device, but we still found it necessary to include something from the Nexus line. Released back in 2013 The Nexus 5 is arguably the most popular Nexus device to date. Made with vision of giving users a clean vanilla Android experience at a low level THE LG HAS managed to capture the popularity that previous Nexus phones failed to achieve. The Nexus 5 reviewHistory family Nexus Specs were great, and the price was amazing as well. The phone came unlocked directly from Google, and sold very well. It's got plenty of lasting buzz as well, and community development for the device is still thriving. HTC EVO 4GAs more population have adopted smartphone technology, the speed of the network quickly (no pun intended) has become a pressing issue. Many users have become restless with the limited capability of 3G networks, so in 2011 HTC introduced the first device capable of 4G. Aptly named EVO 4G, the device was both cost-priced and full featured. It really struck a chord with users who wanted the latest technology on a fast network. The device received huge praise and sold 5 million units by 2011. Not only was it a fully solid smartphone, the EVO 4G has undoubtedly paved the way for 4G devices and network capabilities since then. Huawei Ascend Mate 7The Mate 7 was aimed at the arena as Huawei's ongoing efforts to break into commercial success in the global market, and this certainly fell short of that. The Mate 7 has made waves in the Android world, being another device that has managed to achieve global success at a low price. Users scrambled to get their hands on the unlocked device, and room sales rose through the roof. The build quality was top notch, and looped mate 7 as a durable, durable device. The Mate 7 even secured our editors' choice award in 2014.LG G2In 2013, LG released the famous G2. The flagship was another case of highly customized equipment packed into an inexpensive device. More than 3 million units of the device sold, which is certainly indicative of the popularity of the phone. The device also broke the shape as far as the design with physical buttons located on the back of the device. It was often said that Big2 was far ahead of its time. The G2 is easily one of LG's most memorable devices to date, and has achieved further success since its release. Motorola Moto X (1st generation) Mega-manufacturer Motorola was not going to lag behind newcomers, especially after the acquisition by Google in 2012. Google's first Moto phone was a hand in design already ready to meet high expectations, and the 2013 Moto X certainly delivered. The Moto X stood for something that many other OEMs didn't realize at the time the Moto X was more than just a Google/Moto phone though. This was actually behind what many other OEMs didn't seem to understand at the time. The Moto X proved that the phone doesn't have to have top-line specs in order to work well. This, combined with a quick software experience, unique design and The Moto software features thrown in really made this phone a success. Successful, and support is also deployed at a fair pace, leaving little to complain about how long longevity has gone. Nokia 3310What is the roundup of truly iconic phones going complete without the Nokia 3310? Introduced at the end of 2000, this device was quite possibly the first portable phone many of our old readers have ever held in their hands. It has been described as a tank, a parallel that really only extends to the durability of the phone, since it does not consume energy, run loudly, or pack bulky volume like its literal counterpart. It was small for that time, but housed numerous functions that his predecessors lacked. Owners of the 3310 are likely to remember their first-time ability to disable their phone, compose long SMS messages, and experiment with custom tuning thanks to Nokia software profiles and physical Xpress-On Covers. If you owned one personally, or just used a device of parents or siblings to bug them on a bike through preset tunes or play Snake, chances are this phone touched your life somehow. OnePlus OneOnePlus is the only company on the list that has actually created iconic status since their first release. Boldly dubbed the flagship killer, One debuted in 2014. The slogan was quite fitting as OnePlus' first venture into the world of smartphones really shook things up. OnePlus One reviewOnePlus One vs. OnePlus 2The price one was incredibly affordable, but the phone shocked consumers with its quality. The firmware from CyanogenMod beamed brightly as a feature that many users did not experience. The beastly device comes in an unlocked state in a long list of countries, and continues to do its rounds in the community. Our employees and consumers alike remain impressed with the impact this phone has made on the community. OpPO Find 5Thit power plant device was unleashed in 2013 by a company that had not previously developed or manufactured smartphones. Being a stranger in a game is never easy, especially in the post-Galaxy S3 world, but OPPO had lofty goals. The first OPPO device, Find 5, was a magnificent success and rose to prominence, providing great specs at a low price. This trend has become the fastest way to create a name in the Android world. Our review explains all the features that made it a great phone out of the gate, but stellar sales, constant support, and lasting longevity helped cement its place as an iconic phone. Palm PreThe increasing ability of smartphones quickly signaled an end to PDA units, but Palm refused to go quiet. In 2009, Palm released a revolutionary device called Palm Pre. Pre was solid portable, featuring both a slide-out physical keyboard and a capacitive touchscreen display, rather than an inaccurate, sensitive to This generation's touchscreen display. Not only does Pre feature impressive equipment, but also way for many modern day software features. Pre has a simple card style user interface that allows users to easily switch between them and shut down apps. This design feature will later become the standard in the recent app menu for Android and iOS. Like many of the outdated devices on our list, Pre continued to receive loyal support away after it was discontinued. What's the most beautiful phone of all time? Samsung Galaxy S3After a number of moderately successful iterations of their Galaxy line, Samsung was hungry to break through with the game-changing device. In an attempt to go to the throats of leading smartphone manufacturers, Samsung has entered the 18-month phase of development of its newest device, which will be released in 2012. The result of this undertaking was a truly innovative phone that demanded respect and strengthened Samsung as a key player in the mobile technology it is today. Samsung Galaxy S3 review7 years of Samsung Galaxy - From rags to richesThe launch for S3 was a massive event that highlighted the phone's symbiotic relationship with the natural world. For years to come, the success of the GS3 will strengthen Samsung's strength as a company and propel them to the top of the smartphone world. There was no Android device at the time (or perhaps ever) that could match the impact that the Galaxy S3 had on the world, and some users still find the device quite capable years after it ceased. Sony Ericsson P900In 2003 Sony Ericsson P900 made it way into the hands of many fastidious globetrotters, entrepreneurs and business travelers alike. Not limited to the GSM phone world capabilities, this portable also served as a touchscreen PDA complete with a stylus, opened by Symbian OS, and a mobile RIM email app. Users also enjoy expandable memory, removable battery, and Bluetooth connectivity all at the turn of the century. The flip cover was a good feature, and the scroll wheel added a physical aspect to the navigation to the phone that many manufacturers have not yet entertained. The device relished in great commercial success at the time, and many purists found the P900 quite capable of carrying them in the late 2000s and beyond. For this reason, it makes our list on a really memorable portable device. Xiaomi Mi 3Despite achieves success on the mainland with their earlier models, Xiaomi were big targets. In 2013, with former Android vice president Hugo Barra at the helm, Xiaomi released the wildly popular Mi 3 device. The flagship boasted incredible specifications at the world famous low price. This phone has almost set a quality standard within its price range. The well-established MIUI leather got its best platform to shine with the Mi 3 as well. Users can even eradicate not voiding the warranty. Mi 3 sold 200,000 units 3 minutes after its initial launch, and the trend continued as the company's company their global reach. Aspiring customers shelled out almost every sales output in record numbers as Xiaomi expanded its market to other countries. All this was a really well-executed feat for the Chinese manufacturer. It wasn't easy to choose this particular handful of devices in the spotlight as the most iconic phones to date, however each device proudly meets the cut. Feel free to let us know which device you're holding to heart for whatever reason below! Below!
