

"Ranking universities on their sustainability efforts"

This interactive presentation is a joint effort by Studenten voor Morgen, initiator and organizer of the sustainability ranking for Dutch higher education, and Coöperatie Leren voor Morgen, a cooperative that supports and strengthens this ranking. The ranking called Sustainabul, is a bottom up initiative that started in 2012 because of a lack of understanding and clarity about the sustainability efforts of Dutch universities. Today this ranking has evolved into the most important mechanism to challenge universities in becoming more sustainable, since there are competing with each other to achieve the highest possible Sustainabul ranking. People can learn from the Sustainabul ranking and why it's so unique, they will also help others to start their own ranking!

There will be room for dialogue and collaborative thinking. They would like to hear your remarks or points of improvement.

THE NETHERLANDS

She is 22 years old. She loves trips to places where the earth seems to be untouched by the human species. During these travels she encountered a lot of different types of ways in which sustainability is or is not interwoven in society. This is where her passion for sustainability has grown. In addition, education is a recurring pillar in all her activities: she stood in front of the classroom, she also works as a tutor and examiner, and she loves to start conversations with pupils/students about controversial topics. In order to really realize change, she sees education as a good starting point.
