Initial results are very positive: audience numbers have increased, overheads have been significantly reduced, and the organisation has reduced management to bring the BBC closer to its viewers. However, employees say they do not feel that their views have been heard and believe that there is little cooperation between members of different units. Dyke wonders what else, if anything, can be done to address these other problems and unlock the unrealized creativity he feels exists at the BBC. As the head of an organization with a public service mandate but a private sector competitor, what can Dyke do to boost morale and creativity while satisfying his many constituencies? Related topics: Newsletter Promo Summary and excerpts from recent books, special offers, and more from the Harvard Business Press Review. BBC America is home to many fantastic British shows in North America and you can broadcast it all online whether or not you have a cable subscription. If you've missed a few Doctor Who episodes, or you just want to tune in to the live stream of the BBC America cable channel, we'll show you exactly how to do it. There are two ways to stream BBC America: through the BBC America website and app, or through a television streaming service like YouTube TV or Hulu. Both methods require high-speed to the Internet, and both methods allow you to stream BBC America content on your computer, phone, game console and even TV using a streaming device like Roku. Elva Etienne/Moment/Getty Images If you want to use the BBC's official BBC website or app, you need to have access to login credentials to a valid cable or satellite subscription. If you have a cable subscription, or someone is willing to provide you with their credentials, this option is absolutely free. Television streaming services are subscription-based and do not rely on cable subscriptions. If you're a cord cutter, the TV streaming service can effectively replace an old cable subscription. If you have a cable subscription, or someone is willing to share your login credentials, then you can stream BBC America for free through their official website and app. All you have to do is enter the cable subscription username and password and you can unlock both live and on demand BBC America content. Here's how to stream BBC America content on the BBC America website with a cable subscription: Go to bbcamerica.com, and click Sign B located in the top right corner of the page. Choose a TV service provider and enter your account on demand. Make sure you see your TV provider in the top right corner of the site. If you see your ISP, you are ready to start streaming on-demand and live BBC America content. Click Full Episodes to access on-demand BBC America shows, Movies to access movies, or Schedule to view live BBC America channel schedules. Like the BBC America website, you can access BBC America apps for free if you have access to cable or satellite login credentials. These apps are also free and accessible to most mobile platforms. Here's where you can download apps for yourself: After installing the app, here's how to stream BBC America on your mobile device, game console, or streaming device: Open the BBC America app, and click Sign In. Choose your TV provider, and enter login credentials if asked. Make sure you see your TV provider in the top right corner of the app and then tap the burger menu. Click shows to access on-demand episodes or movies to access movies on demand. Continue viewing the option is useful if you don't finish the show in one sitting. Click on this option to pick up where you left off. If you're a cord cutter without any access to a valid cable or satellite TV subscription, then the best way to stream BBC America is through the television streaming service. These services work like cable, in that they provide access to live channels like BBC America, but you stream the content of a high-speed Internet connection to your computer, phone, tablet, or any other compatible device. In addition to live television, these streaming services also provide access to on-demand content similar to the website America. This means you can watch new shows as they are broadcast and you can also catch up on the old favorites anytime you like. Each of these services provides access to different sets of television networks, with the biggest differences coming in terms of local channels. Some have a single universal plan, while others have multiple subscription levels just like cable and satellite TV. Here are the best options for streaming BBC America without a cable subscription: Sling TV is the most affordable way to watch BBC America without a cable subscription. Both of their low-cost plans include BBC America, and their slightly more expensive orange and blue plan are also BBC America if you're looking for a few extra channels. This is not the best option if you are looking for local channels, but it is the cheapest way to access BBC America online. They provide a free trial, so why not check it out? Philo TV is one service plan that costs as much as Sling TV cheap options. It comes with BBC America in addition to more than 50 other channels. They don't make local channels at all though, so it's really only an option if you're not interested in your local channels. They offer a free trial, but only for one week. YouTube TV is Google's record in a TV streaming game, and it also has some original content. It's one service plan that's more expensive than Sling or Philo, but this plan includes BBC America in addition to a lineup of 70 other channels. This is the least expensive option after Sling and Philo, and it includes local channels in most markets. They offer a free trial as well. Hulu and Live TV are the main popular Hulu on-demand streaming service with live TV added to the top. It includes a live channel for BBC America, and provides access to a lot of BBC America on-demand content. They provide a 30-day free trial to check the service. FuboTV is a sports-oriented television streaming service that also offers a bunch of major cable channels, including BBC America. If you want to be able to stream live sports like football in addition to BBC America, this is a good choice. ATT TV is now a new name for DirecTV now. His two least expensive packages don't include BBC America, but its more expensive packages do. If you are looking for a huge number of channels and you are not afraid to pay a premium, then it is worth checking out. Following in the footsteps of the hugely popular Raspberry Pi microcomputer and Arduino microcontroller comes BBC micro:bit - and yes, we mean that the BBC. Going on their earlier 1980s involvement in house/hobby computing (30 years ago, BBC Micro computers were a staple in schools and colleges in the UK), this tiny new computer is the result of an astonishing number of partnerships. But what is it for? Launched as part of the BBC Make It Digital's initiative, micro:bit is designed to make it easy for young people - and adult beginners - to get coding and create a range of projects, from programming and games to turn the device into a smart watch. Aimed initially at schools, BBC micro:bit is now available to a wider audience, and when used with a code editor from a www.microbit.co.uk or mobile app, or in combination with other devices or sensors, the potential of this humble little device is unlocked. T it's BBC micro: a bit of a modest 5x4cm PCB depicted here is a BBC micro: a bit, a simple microcontroller that can be programmed on a PC, tablet or smartphone. The code is then compiled and loaded onto the device. A closer look shows the various annotations pointing to the components, a neat touch on a device designed for learning, where the purpose of the onboard components is usually hidden. The USB port is obvious; Bluetooth LE antenna to a lesser extent. With five I/O rings to connect devices, it's clearly even simpler than the Raspberry Pi zero - but a pair of programmable control buttons, an accelerometer, and a 5x5 LED matrix means that a lot of functionality you usually need to buy extra bits for is instead available directly on the board, leaving these 5 I/O ports exclusively for external sensors. Battery delivery (2xAAA battery is required), USB data cable, buzzer, audio cable, bulldog clips and USB stick containing pre-written programs and micro projects: a bit ready to use when you unpack it. Inside the box you'll find a good piece of literature, including coding tutorials, and a mandatory quick start guide. We had a guide for teachers, but once the micro:bit is more widely available, we don't expect you to get this particular document. If you want to get more practical, the website www.microbit.co.uk is the place to go, where you'll find video tutorials and resources, along with a number of editors such as Code Kingdoms Java Script Editor, and Microsoft Block Editor. Projects can be drawn up and saved as .HEX files and transferred via USB to micro:bit. The device can be used either with a PC running Windows 7 or later, a Mac with OS X 10.6 or later, or an Android or iOS smartphone or tablet. Internet access is also required! Indeed, it is for children as useful as a device as it will be for those trying to cope with coding. BBC micro:bit - like Raspberry Pi - is aimed at children, particularly those over 8 years old. It also comes with a set of safety instructions that everyone should read and understand, especially any adult oversight. Thus, our device was also considered by the child. This is Caitlyn, who previously coped with our Raspberry Pi-driven Kano. She's 11, and she understands computers better; she uses them almost daily for school work. Children can start with micro:bit, headline on the web www.microbit.co.uk on where all the important Buttons Create code can be found. Micro coding programs: four coding programs available to BBC micro:bit and they are available on the website as browser-based tools. You can choose from JavaScript Code Kingdoms, Microsoft Block Editor, Microsoft Touch Develop and the old Python standard! The first three come with textbooks, and all four have the appropriate documentation. Getting started is very simple. Here we take a look at Microsoft Block Editor, which can be launched (like others) by clicking on a new project. On the display you will see a menu on the left containing a collection of blocks that can be drawn into the main view. They are customizable, and can be used to remotely control your smartphone's camera or simply manipulate the LED display. By clicking on the launch of the finished program, you can see the view of the program in the micro: bit emulator on the right. It's pretty intuitive. As you can see here, we've created a program that displays some text - static and scrolling - when the A and B buttons are pressed on micro:bit. We first tested it on the emulator before synchronizing the compiled file with the micro:bit itself. Many other options are available, and thanks to a simple block-and-loop approach to programming (demonstrated previously by bbc's own Doctor Who fragrance doctor and Dalek mobile and browser app), a child of any age can quickly get started with the basics of programming. By the way, being a BBC computer project, the presence of their famous adventurer Time Lord can be felt - along with various other popular BBC shows - in pre-written projects that can be found on the BBC-branded 500 MB USB stick. Here you'll find a collection of themed tunes that you can play in glorious 8-bit sound, among them Sherlock, Strictly Come Dancing, the popular Formula 1 motor racing theme tune (Fleetwood Mac's Chain) and of course Doctor Who. You can see what a script-shaped program looks like by clicking Convert - a useful way for young people and everyone who has just overworked in programming to see what the script looks like, away from the building blocks. Bbc micro:bit Synchronization With a HEX file created that contains the program, you need to sync it with the BBC micro:bit. It's relatively simple, and can be done by connecting a micro:bit to your computer via a USB cable. Initial synchronization will adjust your micro:bit, and requires you to keep a close eye on the LED matrix, where the arrows point to the two buttons when they need to be pressed, and the scroll messages tell you what to do next. Create your program through the micro:bit website and then use the compilation button to keep it as. File HEX on your computer. This can be stored in a special catalog of micro:bit projects, or synchronized directly with micro:bit. If you want to copy. Hex out of the catalog, just drag it into the manager's file. Don't worry about these files by taking away too much space on hard hard they are tiny, with the music files mentioned above, just over 400 kilobytes each (about the size of a low-resolution image, and less than half a megabyte!). Micro:bit Mobile apps, as well as connecting micro: bit to your computer, you can connect it to your smartphone or tablet. Apps are available for Android (4.4 and up) and iPhone/iPad (iOS 8 and later) devices, and all you have to do is power the micro: a bit with battery or USB power, and sync via Bluetooth by following the instructions in the app. Both applications seem to be pretty much identical; screenshots and video clips from the Android release. Since then, you can access the micro:bit website to attach to the code, or download any existing code samples included in the app through a Bluetooth connection. For audio applications, be sure to connect the audio cable to the 0 and GND poles, as well as the speaker or headset to this. You can also use a buzzer. There is obviously a huge advantage in having a Bluetooth connection to your phone or tablet. The micro:bit app makes the device as portable as a smartphone and increases its potential as a gaming or wearable device. Almost every child over the age of 11 owns a smartphone. Don't you prefer them to program their micro:bit rather than waste time on Snapchat? What can you do with BBC Micro:bit? A number of projects are available for BBC micro:bit - the ones in your head as well as the ones you find on the site. The tutorial guide presents a trio of projects: alarm, synthesizer and game for catching raindrops. Meanwhile, the compact size of the micro:bit means that the computer remains portable, meaning that it can be shown! Yes, you might think everyone would want to look at the PCB pinned to my chest, but just remember the 5x5 LED matrix on this programmable PCB. Various 3D printed cases and holders are available (such as this compass) and they can be easily fastened or clipped on clothing. Can micro:bit lead the revolution in techno fashion? Time will tell, but the devices look remarkably well pressed to the clothes. Just don't let the BBC micro:bit get wet. The sheer number of corporate partners who have come together with the BBC to produce micro:bit may prove to be a limiting factor in the long run, but ultimately it is a useful and educational piece of kit. (recommended) A great way to start coding with a selection of tools for children and adults alike, micro:bit has a number of useful components on board like an array of LEDs. We hope you like the items we recommend! MakeUseOf has a partnership, so we get a share of the income from your purchase. This will not affect the price you pay and will help us offer the best recommendations About author Christian Cowley (1400 published articles) More from Cowley Cowley bbc compacta english class 12 solutions. bbc book english class 12. bbc compacta english class 12. bbc worksheets english class 12. bbc english class 12 pdf. bbc english class 12 solutions. bbc english class 12 2020. bbc english class 12 literature companion pdf
