## Livro behaviorismo radical pdf

This book is intended to present a possible interpretation of radical behavior as a theory of the mind, which means, in other words, the contextualization of it in the context of the discussion of the philosophy of the mind. What exactly does this contextualization mean? There may be many differences between radical behavior and the theories that make up the philosophy of the mind, including differences in the agenda: the first emerges as a philosophical offering of the science of behavior, and the second has been designed to address the issues that permeate philosophy since its emergence among greeks. The point of this contextualization, then, is simply to deal with some themes of the philosophy of the mind from a radical point of view of behavior, but always given that this work will not exhaust all the problems and all the issues that form this separation of philosophy. This book aims to contextualize radical behavior in the philosophy of the mind through three activities. First, to present a possible answer to the question What is the mind?. The second of these, in turn, requires the treatment of another question, that is, What is the nature of the mind?. The first question is at the heart of the problem of delineation that things or phenomena are considered mental. So it's a search for a conceptual definition of the mind. The second question is addressed to the ontology of the mental, that is, the main characteristics of its existence. In turn, the third activity has no specific question, but it is not important: it consists in the analysis of some minuses, problems and questions presented by theories of the mind through a radical point of view of behavior. It is expected that this activity will represent at least one step towards the creation of a radical theory of mind behavior. B.F. For most psychologists and lay people, all behavior is too simplistic, a stimulus-response psychology that mechanically relates open responses to environmental events, denying the very existence of thinking and minimizing the impact of genetic inheritance (Skinner, 1974). This, however, is only perfectly refers to Watson's behavior (1913, 1924), at least in his most primitive form. This strict or classic behavior has long been abandoned by most behaviors. For example, Hull (1943) and his neo-behavior colleagues slightly changed some of Watson's ideas by incorporating intermediate variables into behavioral explanations for which there is no immediate obvious contiguous cause (i.e. no obvious prior environmental stimulus). Tolman (1932) proposed a different version of behavior that supported the mechanistic explanatory posture of non-mediterraneanism, but sought to define a set of internal acts, states, mechanisms, processes, structures, opportunities and properties as causes of behavior instead of logically derived hull variables (Moore, 2003; see also Koch). Skinner looked at these approaches to methodological behaviors in which they studied clear behavior (i.e., what observers can see) as an indicator of more important processes occurring at a hidden or internal level. Skinner's Radical Behavior (1945) offers a unique conceptual basis for explaining the behavior of a person who does not have close siblings in psychology. Skinner used the term radicality to point out the differences between radical behavior and methodological behavior (i.e. Watson, Hull and Tolman's behavior). That is, radical behavior sees explicit behavior as an important dependent variable of psychology, although it recognizes the existence and importance of undeserved behavior (for example, see chapter 15-17 of Skinner's 1953 book Science and Human Behavior, where he addresses self-control, thoughts and other private events). However, it does not provide a special causal status for such phenomena. That is, instead of placing causal conditions or hypothetical structures, Skinner's radical behavior tried to demonstrate an orderly relationship between behavior and the environment. This approach, in fact, is a prospect of selection (Donahoe, 2003; Skinner, 1966; 1972). Radical behavior sees the cause as a complex interaction that extends on several time scales involving organisms and the environment. This approach avoids a mechanistic cause, presents both open and covert behavior and conceptualizes the body as a locus in which behavior and the environment interact (Hineline, 1990; 1992). That is, behavior develops (or develops) in a person in a complex way, which includes three main sources of influence: genetic inheritance, unforeseen circumstances found during his useful life, and the sociocultural context in which a person develops. Natural selection at the level works on the look to produce the structures, reflexes and predispositions that make up the person. Man is a natural selection product that acts through unforeseen circumstances of survival and reproduction, with hundreds of thousands of years of history affecting their bodies and behavior. Selection also affects individual organisms at ontogenetic levels during their lifetime. Adapting to the dynamic nature of a changing environment, selection by effects or sensitivity to environmental contingencies allows species to evolve to adapt to proximal changes in the environment. The choice on the consequences depends on the behavior of the person with the environment, acting as an agent who chooses and the person as a vehicle, so to speak, about the behavior of interaction with the environment (Hineline, 1992). These unforeseen circumstances shape and establish behavior in conjunction with our genetic heritage and sociocultural environment. The social context is crucial because the social environment in which a child develops has a strong influence on learning. For example, the language of the social context in which a child is created determines the language in which the child learns to speak. In fact, the sociocultural environment of man puts a person in touch with the collective experience of culture (see discussion of Dawkins memes, 1976).
