Download chrome browser for android 4.4.2

Photo: Shutterstock (Shutterstock) Whenever I have to make a download something great using my phone, or, really, download anything to my phone, I always weigh the question Will it burn through too much of my data plan? Against How much do I need this app (or game, or video) right now? While games and apps give you the ability to delay downloading until you're on Wi-Fi, rather than using your data plan to do the same for downloads started through a web browser is harder; Usually they will shoot from the minute you click on the link. Or they will, if you activate new settings in Chrome Android lets you delay them, too. You can play with this setup right now. You can find it in any Chrome beta or a slightly less stable Chrome Canary. Start by downloading any browser to an Android device. Once you've done this, type in the following URL in the Chrome address strip: chrome://flags/#download-laterIf it's too much to type, you can also just go with chrome://flags and search for word to download. However you will get there, you will need to find and turn on this flag: Screenshot: David MurphyRestart your browser. Now that you're downloading a file to Chrome (to store your phone), you should see a hint that asks you if you want to download the file now, start downloading it automatically as soon as you're connected to the Wi-Fi network, or schedule a download for a specific date and time in the future. In a report from Techdows, the feature is a bit fussy right now, they report that they've only been able to make it work once. If you don't want to fuss with this setup or can't make it work, there are a number of apps that you can use to replicate this functionality, including Advanced Download Manager and IDM. Your choice! There's no shortage of great web browsers for Android, and which one you use is pretty much down to personal preference. If we had to choose one however, we believe Chrome is the best choice for speed, support on all devices, and integrated features. Google ChromePlatform: Android Price: Free download of PageFeaturesTabbed browsing with familiar, mobile interface ChromeBrowsing gestures, including pull to update, double tap to zoom in, and swiping left/right on the toolbar to switch or open new tabs Supports Chrome Sync, allowing you to access and sync open tabs, browsing history, search history and bookmarks on devicesIntegrate with voice search in Android for a hands-free search and resultsA customizable home screen with shortcuts for wide-viewed sitesMart address bar, which auto-wraps search results and viewing stories as well as you made a typo or a mistake. Built-in support for Google Translate, which can automatically translate pages in other languages to the preferred auto-filling form, which can fill in. address and other information without having to enter it all manually in TheCognito mode, that won't save the search or page historyTo-ized scaling text for availability purposes, and the ability to override page instructions to disable zoomAbility to switch between mobile and desktop versions of sites from the menu bar (if the page supports change)Chrome Data Saver, which compresses and optimizes page requests to save bandwidth (by routing them through Google's servers in the first place) Except Google)One tap of the exchange from the menu bar to any other app on your Android deviceOn-page search through Find on the Google Cloud PrintBuilt support page- in Don't Track SupportDyDecene It ExcelsGoogle Chrome may not be the most many browser features you can download, but it's definitely the fastest and best integrated with Android. It's also so well integrated with the desktop version of Chrome that if you use it there (and you trust Chrome Sync, of course), it's worth using just to be able to pick up your phone or tablet and continue from where you left off on your computer, or vice versa. Chrome Sync eliminates the need to use third-party tools to send links, open tabs, and bookmarks, which is a huge advantage. Built-in support for Google Voice Search and Google Translate are also huge benefits, and while Google Voice Search can be configured to transfer your search queries to another browser if you have one installed, it's a seamless process with Chrome, and Chrome knows that your voice query is a search term and will display the appropriate response, whether it's local weather , a nearby business, or just a word that you want to identify or a website that you want to see. From there, other useful Chrome features, many of which are buried deep in the settings menu, are there if you need them on and off if you don't. The biggest advantage of Chrome is that it's probably already on your Android phone, and it's super fast and well optimized for the platform, unlike many third-party browsers with long launch times, slow download times, and poorly implemented synchronization options. Where it falls ShortChrome the biggest drawback comes in two forms: First, the price you pay for is to be so easy that it's also somewhat feature naked compared to its competition. If better is synonymous with more features for you, then Chrome may not be what you want. It has no extensions or add-ons like the desktop version of Chrome (or even some of its competition, we'll get in a minute.) If you are looking for such additional features, or they are sure to have for your mobile browser, you will want to search elsewhere. Chrome for Android's second biggest drawback is that it, like Android, is well established in the Google ecosystem. Google. both good and bad. For some people, especially considering that you already use Android, it's not a big deal. For others, using Chrome and Android together gives a ton of Google information that you may prefer to have them not, or that you would prefer no one has, especially if you care about the privacy of your desktop browser. Fortunately, if you're worried about privacy and how much data Google gets from your web and search activities, Chrome for Android privacy options allows you to disable things like forecast URLs, and turn on not to track. Dear Lifehacker, with Firefox getting ads and Chrome extensions spying on me, is there actually one... More, whatever it is, given Google's position on things like ad blockers and other privacy extensions that you can get on your desktop, don't expect to see things like HTTPS Everywhere, Disconnect (especially since Google removed them from Google Play because they blocked malware and advertising software), or any extensions or plugins available for the mobile version of Chrome soon. Google has always had a pretty weak set of rules when it comes to apps on Google Play, but... Read moreThe CompetitionFirefox for Android (free) fast, free, open source, and great browser if you use Firefox on your desktop. It can use Firefox Sync to sync bookmarks, open tabs, stories and passwords with you, and it also has a pretty good add-on library, so you can get things like HTTPS Everywhere for Firefox mobile devices. If you can find it for your desktop, it's probably available for Android, including AdBlock Plus, LastPass, Readability, and more. The ability to install extensions means you get a desktop-like experience where your add-ons work inside the browser rather than kicking you into another app that is really great for things like your password manager. The interface is very clean and easy to use without being useless (most buttons are simply hidden in the sidebar that you can swipe), and home panels can be configured the way you like, as do the default share buttons. Firefox's Reader Mode and its nightly browsing mode like doing reading online without clutter, ads, or extra fluff is a joy. His privacy control, expected of Mozilla, is unparalleled. Firefox for Android plays video seamlessly, and it may be better at this than when downloading pages. It was a strong contender for first place here. Android: HTTPS Everywhere, one of our favorite privacy browser extensions, now protects Read moreOpera (Free) has always been good, fast and to ensure that pages are quickly loaded onto any device or connection. The opera layout is spartan, but it doesn't have to be glamorous to get out of the way and show you the web pages you want to see. Instead you get a streamlined experience, a full set of speed, flipboard-like home homes With your favorite sites waiting for you, and more. There is a private viewing mode and a built-in download manager. Also, as always, Opera can compress sites before they are downloaded using Opera Turbo, which saves your data and speeds up page loading. Recent Google Play reviews are everywhere, with users complaining about useful features from previous versions being removed (such as the ability to save images or download YouTube videos),), but I have to hand it over to the Opera team for trying to do user support in response to Google Play reviews. Dolphin Browser (free) is about as powerful as they come, and was our previous choice for the best browser for Android. This is partly due to an extensive library of third-party add-ons. Just like Firefox and Chrome on your desktop, you can add a number of features to your browser to fit its specific needs, whether it's automatically filling passwords, blocking ads, adjusting page brightness, full browser screen, adding a page speed set, and more. Dolphin Connect gives you all the chrome or Firefox synchronization features without limiting you to one browser elsewhere (thanks to Dolphin Connect's expansion for Chrome and Firefox). In addition, the add-on store is packed with plugins and modules for the most popular websites. You'll even get a significant amount of control without installing anything, from changing the user agent (to downloading the desktop version of websites), changing the size of the text, font size, and default zoom, and more. You also get control over web content and scripts, block pop-ups automatically, and more. The customized, built-in gestures of the Dolphin are also very convenient. As always, however, the dolphin's biggest feature is its speed. It's fast on almost every type of device (and especially great on older, low-powered phones, and dolphin jetpack, replacement (and optional) engine viewing you install separately, makes the Dolphin very, very fast. , it feels like developers are paying less and less attention to it, and each new update introduces a few more bugs and problems that weren't there before. Recent reviews in Google Play seem to confirm our experience, with a lot of people still in love with the browser (and don't get us wrong, we love it too), but others report that it has lost the huge lead it had over alternatives a few years ago and is now lagging behind in improvements and regular updates. Dolphin feels like a great product that kind of Stayed on the vine, and combined with the ease and integration of Chrome on Android, it feels as if you want to go where the updates, new features, features, active development and improvement, it's time to move past the dolphin. Some other notable browsers include Maxthon for Android (free), which boasts great speed and tablet views (as well as special tablet optimized versions), as well as packaged rss and options for quickly switching site views, and UC Browser (free), which has a pretty barebones foundation but tons of add-ons built into ad blocking, and focus on video playback. If you're looking for more alternatives, or more on each one, check out our five favorite Android web browsers. There are dozens of great web browsers available for Android, depending on the features that you... Read moreIn the course, these are not the only options. Google Play creeps in with Android web browsers, many of which are one function and focus on one thing (ad blocking, privacy, video, etc.) others are just advertising software in disguise, recording browser history to send, who knows where. Be careful if you're looking for alternative browsers, check reviews (and third-party reviews!), read the permissions, and make sure you choose based on the features that you really need, not just the browser's features promises. Dear Lifehacker, I read your article about Chrome permits last week, but I want to know about... MoreLifehacker's App Directory is a catalog of recommendations for the best apps and tools in a number of these categories. Category.
