Zone archive download

Want more? Advanced embedding details, examples and help! Original title: Can I download the watering history of the zones? I know with IFTTT I can log in to Google spread sheet every time the graph works, but can I log in to each watering zone time? I know I see this in the history of the site, but if there was the possibility of automatic registration IFTTT or even the ability to download a story that would be useful. murph2481: but can I enter each watering area of time? This will help you exactly what you need, just trying to finish it before the new IFTTT Event Trigger soon! The announcement of Ready Work on the trigger event IFTTT, will be submitted for approval next week. What does that mean? Since you know a lot more about the needs of your system than we do, almost every event that takes place in our system can now be tied to IFTTT. This will allow you to essentially build any recipe with any event that is registered for your Iro. For example, California, if the trigger rain sensor is activated, then the action Rain Delay 48 hours Possibilities are really limitless. Current... That would be perfect, I'll follow the IFTTT for those recipes to appear. 1 As I am also interested in capturing the watering history of the magazine in each zone. It can simply include the date, start time and stop time, name zone. This information will be great for me for additional standalone calculations and correlations with other automation systems (well pump, energy consumption and water meters). I have a property with 24 zones included - with constant adjustments to the watering schedule it's hard to troubleshooting why some areas of the landscape aren't very good as there is no easy way to look historically in a particular area. Also, my well struggles and sometimes not enough water to properly maintain the watering system. I would discover when this is happening through a water meter reads and an electric pump log is good. If IFTTT is the way to go, please publish an example on how to create such a journal. But please report if there is another mechanism Rachio would recommend downloading the story - for example, a simple improvement of the existing history of watering CVS download. Instead of using/saving, add the option to see each activity area. sowagreg: If IFTTT is the way to go, please post an example on how to create such a journal. @sowagreg, it can be tracked automatically with IFTTT. Here's a recipe to do this: If you're not familiar with IFTTT, here's a support article that explains how to set up Iro on IFTTT: sowagreg: please let me know if there's another Rachio mechanism would download the story - for example, a simple improvement on the existing watering history of the CVS download. Currently we do not offer this feature, but I will convey the idea of the idea and the food group for further review. Sounds like a great idea! I hope that the IFTTT option will work in the short term. Please let us know if you are working on any prescription issues. Best of all, Emil If IFTTT ever publishes new triggers it can be done easily, but we are waiting 2 weeks for them to approve new triggers. So hurry up and wait! Thx. I'll try to customize using these documents I was able to successfully customize the IFTTT feed in a google spreadsheet. But I also see the point murph2481 makes about the need for additional triggers and data elements. Now I can only capture the information that says in the 1st line on this date, the watering station was on 366 minutes. I would like to capture the exact date, zone, beginning, stop event. Also, if you guys are doing something special to improve water absorption while watering clay/mountain zones - i.e. split a 30 minute watering event into 10 x 3 minute cycles with breaks between and rotation between zones, which would be very cool to capture in the file log. In short, we need more data items exposed to the IFF that can be captured in a log file. By the way, I use Splunk to correlate all my automation systems. I agree glad you understood that. The new IFTTT trigger release should allow you to record zone time, as this will be a new trigger. We're just waiting until the release of it as the Rachio team has already introduced it and it's out of their hands until the people of IFTTT put it online. Wow, splunk, I'm not worthy I said Friday for a new event registered trigger approval. There will be a message when it is live. As @murph2481said, this will allow you to access any event in our system. Well the new event triggers up, so I can call when the zone starts and when the zone ends to get the time tag. The only problem is that I don't get a zone that has been watered. In my Google Docs table I just get The Start area or The Full Zone there are no more ingredients to choose from in the event that tell me the actual zone number. So it's a step in the right direction, but there's still no detail of the zone that has been watered, which would be extremely useful since the flexible schedule doesn't water all the areas every watering schedule it causes. On a lighter note you guys are awesome and I love this thing and the support you have. The new triggers are great and love the system status one, so I immediately knew if there was something with my internet connection on my Rachio. So I don't want to sound super needy just trying to get feedback I think you deserve to do this bullet proof thing! Dan murph2481: The only problem is that I don't get the zone that was in my Google Docs table I just get The Origin area or The Full Area It may let you know when I changed my IFFFF recipes to capture additional details and I'm looking forward to looking forward to spreadsheet with big updates! I like IFFFF and I think it's a fantastic automation interface, so once I start/stop by name zone I'll be very happy. The reason I mentioned Splunk is that I still argue that there should be an alternative mechanism for getting a full log from my devices - on the principle of capturing all the events and analyzing it later. Your website and mobile app interfaces are big and easy to use. If you could continue to insist on both enhancements 1) more events/data points in IFTTT and 2) a simple link on your site to download the device log every month. Rachio has a great product! 1 How hi Franz, any update on progress with the addition of additional ingredients (s) to IFTTT? My logs collect information nicely on Google documents. If you could only add one extra ingredient... The name of the zone / q thx! 1 How sorry, was buried in other THINGS ATM. I'll try to get to that, but maybe for a while. Ping me if the team doesn't get to that in the next couple of weeks. Can you put the full list of items on the IFTTT in the Google spreadsheet? Are they there? Gallons of water per smart cycle event used/not used zone zone zone JCE: Can you place a complete list of note items in IFTTT in the Google table? Are they there? Gallons of water per smart cycle event used/not used zone zone flow zone Play around in IFTTT, I found the list. I would like to ask for a lot more. My goal is to track the cost per zone, etc. and I wouldn't want to insert my own data nozzle flow speed because I can change them in the Rachio application and then forget to change it in the spreadsheet. I would prefer that it automatically pull over these numbers so that I can calculate and track the usage and cost in the spreadsheet. Pinging on demand. It's been a month and I don't see the name zone/I'm as an ingredient. Unfortunately, it's a lot of custom work to get this on and it won't be able to be done in the ingredient. The best thing that can happen is the actual event will have the name zone (without choosing the ingredient). One of the drawbacks of making it so generic. I'll try to get the name zone into the actual event, but it may take some time because of other limitations on our time at the moment. Hi Franz, is there any update on the watering magazine download on the XLS feature? I know you guys originally spends IFTTT for this functionality, but it seems like a lot of work against a simple download link to the website/mobile app (I guess you keep the story of each device on your system for at least 6 months), so the data there is you just need to open it to the owners of these devices. Otherwise, maybe you guys can invest in some visualization tools/functionality for your app to allow owners for a more comprehensive troubleshooting zone and long-term analysis? For example, with my solar panels you can see monthly, weekly daily production, increase and increase, filter by panel and see every production panel, avg for the period, compare this month compared to last year etc. Now things don't grow in my backyard in certain areas and I just can't get a big picture. With constant adjustments to watering/graphics I quickly lose count of how much water each zone received last month and things have improved since I made these adjustments and by how much. Thank you! 1 As on the next page - Before you start, make sure: Create a core zone. - zonecfg -z kzone-name create -t SYSsolaris-kz This step creates a core area based on the Oracle Solaris template called SYSsolaris-kz. Set up the kernel area. To describe customizable resources, see the zonecfg (1M) human page. The following example sets up an area with 8 virtual processors and a 12GB physical storage limit. zonakfg-z kzone-name zonecfg:OpenStackK' select virtual zone cpucfg:OpenStackK:virtual-cpu/ set ncpus-8 zonecfg:OpenStackK:virtual-cpu/ end zonecfg:OpenStackK select zone with Limited memorycfg:OpenStackK:capped-memory/ set the physical zone 12g zonecfg:OpenStackK:capped-memory/end zonecfg:OpenStackK check zonecfg:OpenStackK' output (optional) Check your configuration. - zonecfg -z kzone-name info Install the core area. In the following example, the kernel area uses 50GB of storage space to provide enough space to create volumes for VM instances. - zoneadm -z kzone-name install -archive-path -x install-size-50g, where the archive-path refers to the full name of the location of a single openStack archive. Load the area. - zoneadm -z kzone-name of the log loading in the console area to complete the configuration. zlogin-C kzone-name SCI Tool is displayed to set up the system. If you don't see the SCI tool, click Enter or press Ctrl-L to redraw the screen. Enter the Horizon dashboard. Watch with the OpenStack panel. After installing and setting up after installing OpenStack, log into the OpenStack dashboard to see the available resources in the cloud. Page 3 3
