Image: skynesher/E+/Getty Images Cats vs. dogs are considered one of the biggest competitors in the world, right there with Yankees vs. Red Sox, soda vs. pop, and Yanny vs. Laurel. But don't they really like each other so much? In fact, research into the relationships between cats and dogs shows that many of them live amicably together. The main variable is the age at which they were introduced to each other -cats and dogs growing up together from birth typically form a close relationship. Even in households where a dog and cat were introduced to each other later in life, there's still a chance they can get along. As you might expect, both species have separate approaches to the relationship: cats are typically more aggressive and threatening towards their dog counterparts. On the other hand, dogs tend to be more obedient and outlyingly loving. They are better suited for strict physical activity such as climbing hills or running long distances. The question is, which animal corresponds to your personality? Are you reserved and complex, or loving and active? Just choose your best answers to the questions below and we will tell you which animal companion is the most like you are. PERSONALITY can we guess if you're a cat or dog person? 5 Minute Quiz 5 Min PERSONALITY Which big cat am I? 5 Minute Quiz 5 Little PERSONALITY Is Your Dog Actually a Cat? 6 Minute Quiz 6 Little PERSONALITY What type of dog are you? 5 Minute Quiz 5 min personality can we guess which dog breed matches your personality? 5 Minute Quiz 5 Min PERSONALITY Which Apex Predator Are You Based on Your Myers-Briggs Personality Type? 5 Minute Quiz 5 Min PERSONALITY Cat Race Personality Quiz 5 Minute Quiz 5 Min PERSONALITY Which Dog Race Is Your Kindred Spirit? 5 Minute Quiz 5 Min PERSONALITY Which wild cat is your kindred spirit? 5 Minute Quiz 5 Min TRIVIA Are You Ready For This Tough Dog Breed Identification Quiz? 6 Minute Quiz 6 Min How much do you know about dinosaurs? What is an octane rating? And how do you use a proper noun? Fortunately for you, HowStuffWorks Play is here to help. Our award-winning website offers reliable, easy-to-understand explanations about how the world works. From fun quizzes that bring joy to your day, to compelling photography and fascinating lists, HowStuffWorks Play offers something for everyone. Sometimes we explain how things work, other times, we ask you, but we always examine in the name of fun! Because learning is fun, so stick with us! Play quizzes are free! Every week we send trivia questions and personality tests to your inbox. By clicking On you agree to our Privacy Policy and confirm that you are 13 years old or older. Copyright © 2020 InfoSpace Holdings, LLC, a System1 Company Photograph: amazon.comThe first signs that your pet fleas may come in the form of regular scratching bites to part of his body, but in some cases, cases, might not discover the little black intruders until you see them scrambling over into your home. Not only are flea bites painful for pets, the insects can transfer diseases such as typhous and cat-scratching disease (Bartonella) to your pets, and they can in turn transfer those diseases to people. Erasing fleas from your pets and your home once an infestation occurs can be long and may require multiple treatments, so you may want to consider using a treatment on your pets that kills both fleas and prevents future infestations. Once you discover your pet has fleas, the safest way to proceed is to contact your vet to determine the best flea treatment. Your pet's age, whether it's pregnant or nursing a litter, or having a history of sensitivity to medications or topical insecticides, will help determine the safest and best flea treatment for your furry friend. Ahead, learn what to consider when choosing a flea treatment, and find out why the following products are good options for keeping your pets (and your home) flea-free. Pictured: amazon.comTypes of Flea TreatmentFlea treatments are available in a handful of types, from prescription and over-the-counter medications to shampoos and collars that kill and push fleas. Treatments are also available to drive your home from fleas. Oral MedicationOral meds, generically known as flea pills, work by spreading a systemic insecticide into your pet's bloodstream after intake. When a flea bites your pet, the chemical enters the flea's system and kills it. Some oral medications are only available through prescription from a veterinarian, but others are available over the counter. Typically, over-the-counter meds are slightly less powerful or designed to leave the pet's bloodstream relatively quickly, meaning you may have to give your pet the medication every day for a few days until all the fleas are gone. Prescription-only oral medications provide extensive protection in your pet's system against fleas and other insects, often including ticks. Both types of oral medications are selected based on the animal's body weight. Topical Medication Topical medications possess liquid insecticides, such as permethrin and pyriproxyfen, which are administered directly on your pet's skin, usually between its shoulder blades or on the back of its neck where it cannot lick off the medication. After administration, the drug spreads throughout the animal's skin, and when a flea bites, it ingests the chemical and dies. Like oral meds, topical meds are available in both prescription and over-the-counter strengths, and veterinarians and pet owners should consider the animal's age, weight, and whether it's a dog or a cat when choosing. Some topical medications that are safe for dogs is harmful to cats. Depending on the strength of the drug, it can protect for several days, up to a month, or even longer, before most reapply. This medication penetrates the skin's surface so they won't wash off, although the instructions may recommend waiting a day or two before bathing your pet or letting a pet swim. Shampoo Fleas Shampoo contain ingredients such as pyrethrum designed to kill existing fleas or make a pet's coat so undesirable that the pests willingly leave. Many flea shampoo brands are available to both dogs and cats, but depending on their ingredients, they may not be suitable for kittens or puppies under a certain age, so read the label carefully. If a mother dog and her litter are both infected with fleas, a veterinarian may recommend a shampoo or other treatment that is safe for everyone. Powders Flea powders are mainly used in the house rather than on a dog or a cat. They possess a variety of insecticides, both chemical and natural. Typically, you sprinkle the powder on carpets and upholstery, brush it in, and allow it to stay there for several hours or longer before sucking vacuuming. A flea infestation in a home can develop rapidly because female fleas can lay dozens of eggs daily, and those eggs hatch from 10 to 12 days. The treatment of carpet and upholstery with flea powder should be done at least twice, with the second treatment being 12 days after the first treatment. Spray flea sprays are designed for use on pets, as well as in-house. They contain insecticides that kill adult fleas on contact, and some may leave behind an excess that kills any fleas that hatch afterwards. Use a flea spray only the way it was intended - don't use a syringe for carpets and upholstery on your pup and don't use a syringe for animals on the carpet. Collars Flea collars contain insecticides that kill and secrete fleas and other insects and are usually safe when used as directed. If your pet is likely to slip out of its collar, however, or you have more than one pet, and there's a chance that one will chew on the other's collar, it may not be the best treatment option. Chewing on a flea collar can lead to poisoning, especially if the pet insacks a portion of the collar. When choosing a flea treatment, don't just grab the first product you see on the shelf; consider their differences. Treating fleas is not a one-and-done process-in addition to treating the pet, which you also need to treat his bedding and maybe even your home. Dog vs. Cat Flea TreatmentsCertain chemical insecticides, such as permethrin, safely treat fleas on dogs, but can make cats sick. Use only a product marked safe for your pet - do not use a product intended for dogs on a cat. vs. Chemical TreatmentsManufacturers use both chemical and natural ingredients in their flea treatments. For example, while permethrin is safe for dogs, but toxic to cats, a natural alternative, pyrethrine, which is derived from the chrysanthemum plant, is a alternative to cats. Protection period Some flea treatment products, such as shampoo, are designed to kill fleas immediately and emanate them for several days, while oral and topical medications can last up to 1 month, or even longer, depending on the ingredients. Flea rage can secrete fleas and other insects for up to 8 months. Additional ProtectionDepending on the flea treatment you choose can provide protection against additional pests, such as ticks, mosquitoes, bottleflies and other bugs. These insects can also carry diseases and parasites that can harm your pet's health. For example, a mosquito bite can convey heartworms, a potentially fatal condition for dogs, so you might want to consider using a treatment that kills other pests as well as fleas. Your veterinarian can tell you what types of insects pose the most important health risk in your area. Our Top PicksThe following products will get rid of fleas—and other pests—on your pet and in your home, and are considered safe when used as directed. If you are trying a new treatment for the first time, though, keep a close eye on your pet. If it develops any unusual symptoms, including skin irritation, sedation, watery eyes, or changes in behavior, discontinue use and consult your veterinarian. Photo: amazon.com If you're looking for a prolonged topical flea drug, check out Bayer K9 Advantix II Flea, Tick and Mosquito Prevention, which kills fleas, lice, ticks and mosquitoes and stumps off bite flies. The product begins killing fleas within 12 hours of application and continues to kill them for up to 30 days. It comes in easy to use, single-dose packets and should be applied directly to your dog's skin in a place where the dog cannot leak. Advantix II is intended to treat dogs that weigh more than 55 pounds, and it should not be used to treat cats or puppies less than 7 weeks old. Pictured: amazon.com for quick relief in a topical medication for cats, consider Cheristin for Cats Topical Flea Prevention. The product comes in single-use ampoules and should be applied to the skin in an area where your cat will not lick it off—typically, the back of the neck or high between the shoulder blades. Within 30 minutes, the product begins to kill fleas, and within 12 hours your cat should have full relief from flea bites. Cheristin continues to protect your cat for up to 6 weeks. The medication is suitable for cats about 1.8 pounds, but should not be used on kittens less than 8 weeks old. Photo: amazon.com You don't have to spend a lot of money giving your pet a little relief from fleas with Bayer Advantage Flea and Tick Treatment Spray. The sprayer is designed to kill adult fleas and their eggs on contact and will also kill ticks. It is meant to be sprayed on your pet's head and body (cover the its eyes and avoid getting the sprayer close to the mouth, nose and genitals). Once the fur fur saturated, let the product dry naturally. This spray is intended for dogs and puppies older than 6 months, but should not be used on cats. Bayer also makes a Advantage Spray for Cats, which is safe for cats older than 7 months. Pictured: amazon.com within 30 minutes of ingesting, CapAction Oral Flea Treatment for Dogs goes to work, killing the fleas on your dog. Within 4 hours, up to 90 percent of adult fleas will be dead. CapAction tablets are designed to be delicious, but if your dog won't eat any of your hand, try hiding it in its food. CapAction is safe enough to give your dog one dose a day if necessary, and it quickly goes out of the animal's system. CapAction is designed for use on dogs about 25 pounds, but it is not safe for use on puppies less than 4 weeks old. Photo: amazon.com Consider Capstar Fast-Acting Flea Treatment for Cats as a Safe Treatment for Fleas on Felines. The product was designed to start killing fleas within 30 minutes of eating. These flea-only medications (not intended to kill ticks) can be administered up to once a day — or when you see fleas on your cat. It is made to treat cats between 2 and 25 pounds, but it is not safe for kittens less than 4 weeks old. Most cats like the taste and will eat the pill by itself, but if your cat beams, try tucking the tablet into a little soft cat food or tuna fish. Photo: amazon.com With a handful of natural insecticides and repellents, including lemon gland oil, cedar oil and navel oil, Tropiclean Flea & Tick Shampoo for Dogs kill both fleas and ticks on contact and will continue to push the small bugs for up to 7 days. It is designed for use on dogs over the age of 12 weeks. For best results, thoroughly wet the dog's coat with water and then serve as much Tropiclean shampoo as necessary to work up a rich lather. Don't get the shampoo in the dog's eyes. The shampoo should be allowed to stay in the coat for 5 to 7 minutes before being thoroughly washed away. This shampoo should not be used to bathe pregnant or nursing dogs. Pictured: amazon.com If you've ever bathed a cat, you know it's not the easiest thing to do, but Vet's best flea waterless foam treatment for cats can help. Using the waterless treatment can prevent unearthed howls and painful scratches on your body. It's a simpler (and safer) way to bathe your purrbaby. The product shares as a foam that you can gently massage in the cat's fur, and there's no need to rinse it out. The dry shampoo contains soft essential oils, including peppermint and eugenol, and it kills fleas, flea eggs and ticks on contact. The smell is soothing, but the product should not be used on kittens younger than 12 weeks. Photo: amazon.com for protection from fleas, check out the Bayer Seresto Flea and Tick Collar for Dogs. The Seresto collar will kill fleas on dogs weighing from 5 to 22 and it provides continuous protection for up to 8 months. The collar contains a time-free insecticide that also kills and secretes ticks. The Seresto collar isn't surreasy and odorless, and it won't lose its efficiency by swimming, sunshine, or if you bathe your dog. A dog can carry the flea collar alone or in conjunction with an identification collar. The collar should not be used on puppies younger than 7 weeks. Pictured: amazon.com The Bayer Seresto Flea and Tick Collar for Cats will protect your feline for up to 8 months, and it features three visibility reflectors that shine in the dark to alert you (and motorists) to the presence of your cat. The time-free insecticide begins to kill fleas within 2 hours, and after 48 hours it will prevent tick infestations. Nongreasy and odorless, the Seresto collar for cats is designed to be used only on adult cats and kittens about 10 weeks old. Photo: amazon.com For a safe and natural treatment of your pet's flea problem, check out Harris Food-Grade Diatomaceous Earth (DE), which is made from finely ground fossils of diatoms, a type of algae that grows in fresh water. This nontoxic white powder can be sprinkled on carpets, pet bedding, and even rubbing in your pet's coat to kill fleas. When fleas and other insects come into contact with DE, the powder – which feels smooth for the human touch – cuts the insects' soft underbells, causing them to dehydrate and die. Food grade DE is safe enough that it is often mixed into pet and livestock food to control internal parasites. Sprinkle the powder around doors and foundations to also kill unwanted insects. Questions about Flea TreatmentNop one likes the idea of a pet suffering from flea and tick bites, but if this is the first time you've treated your pet, it's only natural you have questions. Here are some commonly asked questions and the answers.Q. How do I check for fleas? If your pet has fleas, the first sign is often the pet who scratches himself with a hind leg or intensively chews on another part of his body. To verify if the problem is fleas, brush aside your pet's fur and look for small, black, fast-moving bugs on its skin. Fleas can also jump out of your pet and race in your home's carpets and upholstery, so watch out for small black bugs there as well.Q. What is dog flea medicine, and how does it work? Flea medicine contains insecticides designed to be applied to your pet's coat or taken anywhere. The most powerful medication is only available through prescription, but many over-the-counter flea meds will also offer relief.Q. Should I choose an oral or topical treatment? It's really up to you and your pet. If your pet takes medication without a hype, oral treatments are quick and convenient. If your stubbornly refusing to take medication even when they are disguised in its food, a topical medication may be easier for both of which What ingredients kill fleas? A wide variety of chemical and natural insecticides can kill fleas; some of the most common chemicals include fipronil, s-methoprene, imidacloprid, and permethrin. Natural ingredients, such as umbelic oil, cinnamon oil, and diatomaceous earth, are also popular for killing fleas.Q. How long does it take to break the flea cycle? Under optimal conditions, it takes about 12 days to break a flea cycle. It takes about 2 weeks for a flea egg to hatch and then mature to the adult stage when female fleas can lay eggs. Along with treating your pet, if fleas are in your home, you should treat your pet's bedding, the carpets and the upholstery twice. The second treatment should be 12 to 14 days after the first, which will kill any fleas that hatched after the first treatment. Treatment.
