## Diagnostico definicion pdf

We explain what diagnostics means and in what areas the term is used. Medical, social, business, differential and more diagnostic. Medical diagnosis is the most common and best known use of the term. What is a diagnosis? Diagnosis is an orderly, systematic procedure of cognition, a clear setting of circumstances based on specific observations and data. Diagnosis always includes an assessment, with an assessment of actions in relation to the goals. The term includes the Greek word gnosis, which means knowledge. Determining andraj de Souza's diagnosis: A method of knowledge and analysis of the activities of a company or institution, both inside and outside the company, so that it can facilitate decision-making. Implementation of an adequate diagnosis requires those who will perform certain skills or competences, among which we can cite theoretical knowledge of the subject, logical reasoning, concentration, experience and greater ability to observe with objectivity, and correlate different data. Medical diagnosis is the most common and best known use of the term in which before a person who shows certain symptoms (e.g. fever, cough, sneezing, chills), the doctor must determine what may be causing these symptoms. That is, you should diagnose (i.e. identify) the disease based on current symptoms, medical history and, in some cases, additional examinations (X-rays, blood tests, etc.). As a result of this basic use, the term has been extrapolated to other areas, although in all cases the central idea of a systematic procedure for identifying the problem remains. For example, it may be necessary to diagnose why the company is not all well, why in a certain place of drop-out, why few students graduate from this university, why people change medical prepayments, etc. See also: Phobia Other types of diagnosis of psychodiagnosis is used to identify psychological problems. Other specific diagnostic cases will be mentioned below: Psychodiagnosis. This is a process that psychologists and psychopedagogues usually carry out within educational institutions to identify psychological problems that can affect the normal education of children. Differential diagnosis. Perhaps one of the biggest challenges for health professionals is to distinguish between diseases that occur with a very similar clinical and/or laboratory picture; in such cases, doctors must make a differential diagnosis, sometimes supported by the cull procedure. Diagnosis Social worker services are sometimes requested to assess a person's marital status; in this case, the social worker often visits your home, sees what amenities you have and which ones you lack, for example, to get an idea of your most pressing needs (such as subsidies), Image diagnostics. It includes all those medical tools that manage to get images of the body and by analyzing these images it facilitates the diagnosis of diseases or injuries. It ranges from X-rays to CT scans, ultrasounds, MRI scans, etc. The latest edition: September 12, 2020. As quoted: Diagnosis. Written by Maria Estela Raitino. From: Argentina. K: Concepto.de. Available in: . Received on October 1, 2020. Diagnosis is a word that has its etymological origin in Greek, and even more so in the union of the three words of this language. Specifically, it is a term that is shaped by the prefix diag- which means through; the word gnosis, which is synonymous with knowledge, and finally suffix-ico, which is defined as relative. Diagnosis is what is connected with diagnosis in the field of medicine. This term, in turn, refers to diagnostics: data collection for analysis and interpretation, which allows to assess a particular condition. For example: the doctor said that he will give me a diagnosis tomorrow, I'm sorry that the diagnosis is not encouraging, hundreds of people are waiting at the door of the clinic for diagnosis. In medicine, therefore, the diagnosis seeks to reveal the manifestation of the disease from the observation and analysis of its symptoms In this sense, we can establish that there are different types of diagnoses, such as pregnancy, that of different types of cancer, premature or genetic, which is performed on the basis of DNA research. This can be differentiated, however, in the diagnosis, which is done in clinical medicine (which involves observing the signs of the disorder to recognize the disease) and diagnosis in care (the human data is studied to recognize what problems are part of some care planning). To develop a clinical diagnosis, your doctor continues to physically examine the patient. You can also discuss your medical history (your health history) and order additional research that will allow you to gather more information about the state of your body. In addition to what specifically corresponds to medicine, the concept of diagnostics can be used in colloquial language as a kind of synonym for analysis or research: My diagnosis that Andrea is tired of your uncertainty; she needs more commitment from you, What is my diagnosis? That the team needs at least three reinforcements to get out of the last places in the leaderboard. It should be emphasized that the world was shown an American television series called Murder Diagnosis, which came out on the small screen in 1994 and was on it until 2001. It revolves around the figure of Dr. Mark Sloan (Dick Van Dyke) and her son, Detective Steve (Barry van Dyke), who together are responsible for finding out some murders and murders. In audiovisual questions it should also be noted that there is a film called Diagnosis of a Psychopath. In 1993, she saw the light of day for this production, starring Jane Wheeler and Sean McCann, which revolves around a figure gynecologist who is traumatized by the death of her mother during the birth of her brother she killed. The fact that has now led him to decide not to make children born. The diagnosis is the result (s) that is made after research, evaluation or analysis of a particular scale or object. The purpose of the diagnosis is to reflect the position of the body, condition or system so that the action or treatment that has already been intended for treatment or that the results of the diagnosis will be decided on whether to be performed. X-ray plate, blood test, ultrasound... These are all typology medical studies that a professional can order us to perform in order to know the condition of any part of our body or any internal process that occurs in it, and then, be able to chart the treatment to follow us, indicate drug use, recommend life habits or begin surgery in case we need it. However, this is not the only situation where we can be involved in diagnosis. In many educational institutions, when they enter a new academic year or academic cycle, teachers often ask their students to take an assessment that seeks to know exactly what knowledge students have, which ones they have learned in previous years or cycles set more accurately in their knowledge. From these results, the teacher will know if there are topics that need to be explained or reved again and then move forward with the curriculum on the subject. But, the diagnosis may not have as one point of study of a single person, but also a lot, or rather we could say, a social whole as a change process. What does that mean? Ok, if we wanted to start a small ice cream company. Do we know for sure if we succeed? It is normal that in such cases much depends on business intuition, but we can ask a professional, for example, economics, to conduct market research: do the people of my city really need an ice cream parlor? Would you consume my products? What do you expect from the company in this area? It's also a diagnosis, and it helps me take a better look at the social situation before setting up my company. Of course, as we have said, intuition is important, but perhaps we can avoid future failures or better anticipate our trading strategies. Another type of diagnosis, although commonly known as soil research, takes place with the analysis of a given surface of the earth, and usually a small measurement where someone intends to carry out construction or, conversely, needs to assess the soil for the purpose of producing crops or devote themselves to livestock. Diagnosis is a type of analysis performed to recognize the condition of something. The word diagnosis comes from the Greek term diagnostik's, the meaning of which indicates something inclined to know. The diagnosis is related to diagnosis and refers to the element used for diagnosis. By diagnosis, we mean a form of research that is conducted in order to know the trends and aspects of the situation. A certain amount of data must be systematically monitored and organized in order to make a diagnosis. In this way, we will be able to make a better diagnosis and effectively judge the situation. Diagnosis is widely used in the field of medicine for the detection of diseases or pathologies. In this discipline it is called a medical diagnosis, although it is also known as clinical proteutics. In medicine, diagnostics are used to analyze the health of patients, to identify disorders or symptoms of any disease or disease. This is a study that is done to analyze the state of one thing. Within medical diagnostics there are various typologies that are used to suit needs or what is intended to be studied. Thus, we have a differential diagnosis that aims to detect disease or pathology by discarding others with similar symptoms. There is also an image that uses different techniques to take pictures of the human body looking for possible symptoms or disturbances. Other types of diagnoses include early diagnosis, which is part of the public health epidemiological program. This diagnosis is intended to lead to the primary detection of virosic, contagious or Population. In addition to identifying them, it aims to reduce the effects of these diseases or their spread in society. In addition, specific diagnoses detect different types of cancer, vary by type. There are diagnoses related to pregnancy or fertility of a person, the diagnosis of pregnancy is made to confirm its existence. A non-invasive fetal diagnosis can be made during pregnancy to detect any genetic abnormalities. Other types of diagnostics, as well as diagnostics are widely used in the field of medicine, its use extends to related disciplines. This is how psychology is up and about the patient's psychological picture. This diagnosis is designed to determine whether there is any mental, behavioral and/or emotional disorder or illness. After a diagnosis related to medicine is a diagnosis of care. This type of diagnosis is part of the care process where patient data is examined to detect problems or inconveniences they will encounter in this case. Leaving the medical field, you can make a diagnosis in the field of education. In this case, it is a pedagogical diagnosis, where an assessment is carried out, which examines the educational potential and development of students. This diagnosis is aimed at finding the best ways to implement educational plans in accordance with existing needs.
