

KEY BENEFITS:

- Significant water saving with reduced flushing
- Negates need for aggressive chemicals
- Completely ECO Friendly
- Reduces foul urinal odours
- Keeps your urinal drains clear
- Prevents urinal “backing up”
- Imparts pleasant fragrance
- Quick payback on rentals
- Better than standard urinal cubes
- Reduces plumber call outs
- Reduces cleaning costs
- No install issues
- Part of the REVIVE Range

INTRODUCING THE REVIVE RANGE:

1. New quarterly specific colour coded Bactiballs delivered to site
2. Old coloured Bactiballs removed
3. New colour Bactiballs placed in the urinals by maintenance staff quarterly

HOW THE BACTIBALL WORKS:

Every time the urinal is used or flushed fluid passes over the BACTIBALL and erodes a small amount of friendly bacterium into the drain. The bacterium then replicates itself while it devours foul odour causing bad bacterium and softens the hard uric scale deposits ensuring the drain remains serviceable and hygienic, the flushing water assists the bacterium to move down the drain consuming more waste as it goes.

HOW THE BACTIBALL IS FITTED:

The BACTIBALL is simply placed directly into the urinal bowl or if required an optional holster with suction cups can be secured to the urinal (plumber not required). The flushing rate can then be significantly reduced and adjusted to the customers needs and requirements saving water and money.

Our bacteria based Urinal Bowl Cleaner (UBC) is used to spray the urinal bowl and surrounding areas daily during normal washroom cleansing duties.

This not only cleans and fragrances without using harsh chemicals it also adds to the friendly bacterium and allows them to work in and around the urinal as well as the drains. The BACTIBALL complies with the requirements of building and water regulations.
