## Diablo 2 save location windows 10

A script to hex-edit single player file save in Diablo II for patches 1.13 and 1.14. Script requires only python (2.7 or 3.x) and numpy, and should work on Mac OSX or Windows. Apr 29, 2018 PC Diablo 2 Game Save. The necromancer, level 99. Interested in finding more information about Save Game World? Then it's your lucky moment, because in our site you will find different files Save the game will help you develop the game. First back up the python save file d2hax.py -reset-arreat -difficulty 1 -file %Applications/Diablo II/Save/sopax.d2s works. D2 single player save the file is a mostly deterministic, binary serialization of some data structures that persist the state of your character and progress in the game. Note: I only tested it on 1.14d on Mac OSX with a character in normal difficulty. This code could also be a good starting point if you want to learn to programmatically edit the D2 save file. The script re-allows your ability to reset state and skill points through Akara in Normal Act 1. Make sure you have completed Den of Evil first. The script unlocks all crossing points in all difficulties. Currently untested for Nightmare and Hell. The script can reset your search for forge hell, so you can re-kill Hephasto and reap the rewards on the forge again. The script can reset act 5 quest from Lanzuk with the Socket reward, so you can socket as many items as you want. The script can reset act 5 quest with reward three runes, so you can farm low level runewords. D2 single player save the file is a mostly deterministic, binary serialization of some data structures that persist the state of your character and progress in the game. So, without knowing the individual fields of the structure, we can use the test and error to find out what each part of the save file represents, byte by byte. We change a certain state in the game, look at the binary dump and examine which bits have changed and what was their gap in the file. Then we can modify these bits and apply a control amount over the new binary data. As a result, we edited the data that persisted in your character's save file. Here are some Diablo 2 save games / Diablo 2 character files / Diablo 2 files for single and open battle.net. Click link on the character you want to download, click save and save it on the desktop or somewhere where you can find it. Now find the file called save in diablo 2 folder, if you have trouble finding right-click the Diablo 2 icon and click open the location file, or if you have Windows XP you will need to go to Diablo 2 properties and then click Find When you click open file location, you'll see a file called save, open the save file. Now go to the character file you downloaded and copy it (ctrl +c). Then, after opening the saves file paste the file (press ctrl + v) into the save folder, now open Diablo 2 and go to player or open battle.net and your new character will be waiting. TIP: the characters were made below: CREATE YOUR OWN HACKED CHARACTERS VIA LINK: SadicFreak, Fpc1epc2apc5r, KC, FreeStuff\_forU, and pyro-armagedden, you can download as many characters as you need as you please. Have fun with these chosen characters by hand! Note: hacked Diablo 2 characters and iron virgins in hell some do not mix. Melee attacks an iron maiden at her own risk of dying on the spot. Hopfully your pop-up blocker wont get in the way when downloading! If you need to, turn off pop-up blocking so you can download. All characters are softcore expansion.. SelectionFile type iconFile nameDescriptionSizeRevisionTimeUserSadicFreak.d2sView(10/10) Lvl 13 Paladin - don't let the #level change your opinion. This character is the best on this site! I would recommend it. April 9, 2015, 7:14 PMRichie Con.? FearView(9.5/10) This character has a colorful name (hack)! And all kinds of great goodies. It's a wonderful experience! April 9, 2015, 7:17 PMRichie Con.FreeStuffFor\_UView10/10 this has gfg elements! Enjoy! April 9, 2015, 7:26 PMRichie Con.-KC.d2sView(9/10) Lvl 97 Barbarian - KC is a character who legally started back in 2000, when the game came out. He was amplified with some hax. April 5, 2015, 7:27 PMRichie Con. I was getting back into the game some good'ol D2 last week or so, since I noticed that there was a recent Carder Reset while randomly logging into my old Battle.Net characters. Most of my accounts were closed due to not logging in enough and those characters lost... but that's just a chance to make us! Below, I show the changes that I noticed occurred in the recent update and how things worked for me in Windows 10 – and I also show you to use The Carder-Runewords Only in single player adventures – enjoy! [Update: Note for Patch 1.14D at the end of \*\*] [Update: Personal note also at † near the end, certain Runewords are not working?] [Update 2017-01: Added short tutorial near bottom on how to display file name extensions (.txt) if necessary] For those of you interested in the game (or never stopped playing) Diablo 2, you may have noticed that there was both a Reset (on May 17) and some new patches (up to 1.14 now). Although I personally had no problem with these updates, some people have after you can see if you browse the Support Forum for Diablo II (under Classic Games at BattleNet). Here, though, I want to get in that I noticed with these patches, how the game worked in Windows 10 for me personally, and how Windows seems to handle the game files themselves now. For example, Save Games for Diablo2 are no longer kept in the installation directory (the folder where the game is installed at) - as the 1.14 patch they are now located at: C:\Users\&lt;USER NAME &gt;\Saved Games\Diablo II The location above is now where your . D2S and . MAP files are kept (your character save game information) - and where we're going to get The Carder-Only Runewords working in Single Player mode in a bit. The above location assumes that C: is the main Windows drive/partition (where Windows is installed to, which is created and used automatically by default) and it should also be noted that the username or login name goes where it says &lt;username &gt;. [obviously for some, I know, but not everyone knows these things at first]. While I'm not a developer for Blizzard, looking at the effects this will have with Windows, I assume this was done to create a maintenance save game system for people who upgrade from Windows 8.1 to Windows 10 as an upgrade [or need to reinstall the game itself] will not now affect save games in any way and they can then still be found afterwards by Diablo 2 (Single Player, etc.) [by using this configuration directory]. I have to give Kudos to Blizzard to return and update a 10+ year old game, to address compatibility issues and streamline how the game works with Windows (updating installation files to do the above things – not to mention another fun scale reset)! Initially, I was running D2 directly from my old location (from a previous windows install), which was something like P:/ProgramFiles, etc. and just clicking. EXE over there. I wanted to test the downloadable installer on the Site BattleNet [to do a digital installation as opposed to a disk installation], to test how well it worked with Windows 10 and found that Launcher did not work at all for me ... It showed Diablo Play and a button for Uninstall, but clicking these buttons did nothing... At the time, these buttons didn't work at all... I looked around forii BattleNet, but nothing was said – at least about problems with Setup doing so – so I did some troubleshooting of my own and found that Diablo2 was not listed in the programs and features section (Uninstall or change a program) of the Windows Control Panel. This has understandably since I was running from an old installation folder – one that Windows 10 does not automatically know about because installing 10 as a Dual-Boot with Windows 8.1 [on this system] - I have not gone through the Diablo2 installation process with Windows 10 at this time. I assumed that the installer was a little confused about things, so it was also using [created] new saved games saved talked about above, but I don't know where D2 was actually installed at. So I went to the site Battle.Net and downloaded the latest version of the Installer for Diablo II – which can be obtained by logging to the site and going to Manage My Games (Account Management) and then D2 can be found under Classic Games at the bottom of the game list. Blizzard has set up as a small file that you download a launcher, which will then run and actually retrieve the rest of the game (installation). After downloading the Launcher file and running it, it will make a longer download of the installation files (tell him where to save them). Then it will automatically run the installation of the game itself [did it for me]. Now, after completing the installation game, once you run the game itself, it will retrieve the latest Patch to install; but while you try the upgrade, it can run into a problem where it will say: Patching cannot be completed because the patch archive is corrupted, and can stay in detail later ERROR: unable to open the archive D2DV\_IX86\_1xx\_114d.mpq At least, this was the error message for me - if you would not continue installing the game (this was in Windows 10). I downloaded the installation a second time (just in case there was some corruption of the files during the download) and the message came up once again. A quick trip to the Battle.Net Support Forum and a search did not work (your search has no matches), so I did several troubleshooting ... During this time, another issue that I ran into was a pop-up message (in Windows 10) saying: WINDOWS PROTECTED PC Windows SmartScreen prevented an unrecognized application from starting. Running this app can put your PC at risk. Now, although a very useful feature and protection in Windows 10, I had just downloaded this installer directly from the BattleNet site, so I knew [well, it was 99% sure] that the installer was ok, so I clicked Run Any anyway.... For those who are wondering, this error message, which stated Unknown Publisher, is a protective layer in Windows, where Microsoft personally tests installers and programs, making sure they can run and are safe to use in Windows. When they can verify this, they will certify that program or application. When they can't do this (or haven't gotten around to it yet), this message will essentially alert you, saying hey, we haven't tested this ourselves yet, we don't know what this does to your system, but it looks like it's changing stuff. Again, while this is actually a useful measure, I know I just got the installation straight from BattleNet, so I chose to run it anyway. In by the way you obtained the software/program/application, you may want to double-check things and/or download them in a more direct manner [just a suggestion!]. The reason I mention these messages is because these types of errors can usually be solved by One thing: running the application (in this case, Downloader/Installer) in Administrator Mode (by right-clicking . EXE that starts the program and choose Run as administrator). This is because the first error message above suggests a file access issue (could not modify the file needed to modify, which is usually a permissions issue) and the second message was a protective, warning measure (which may occur anyway, regardless of its running in administrator mode). Diablo II Downloader do it's thing... Downloading This means that for most, when the Downloader (which has a mostly blue menu interface, shown even above) is finished retrieving the installation files, it will then try to run the installer itself (which has a mostly Red menu interface, displayed just below) - and if none of them are running in administrator mode (to allow full access permission to the files it needs to work with), it may not be able to modify/change the files it needs to – and these messages may come and may not be able to continue installing the game. Diablo II Installer interface A way around this problem (for example, with the inability to open the message archive), is to interrupt this process automatically after the Downloader retrieves the installation files it needs. This means that when the Downloader is finished (mostly blue menu will turn into a mostly red menu), exit the installer for now. Then go to where you saved the installation files and find the Installer.exe file, right-click it and choose Run as administrator to allow full permissions to the files it needs to access [the file can only be called Installer if you have default Hide extensions for known file types check box checked on the View tab of Windows Folder Options, something I personally prefer off, but it is good to leave on]. Doing the above, both the download and the actual installation processes should now complete and D2 is now installed in your system again, ready to play - woot! A few last points I would like to note: There is no need to run D2VidTest.exe anymore, after his mention of Blizzard here. In fact, looking in the installation folder for Diablo2 now (in Windows 10), it is not even present to run ... [Although I've heard of people having problems with specific hardware and who need to run it (wires of this can be seen in the Official Support Forum), I personally didn't have to run it and didn't have with installing and running the game in Windows 10 - therefore, my first suggestion for those who have problems, would be to re-download the newest version of the Installation Program from BattleNet - because it was with a very recent re-download of that (which included recent updates, etc.) and the operation of the installation (with administrator permissions) that I had no problem appearing ... Hopefully this will be the same for you World Drops seem to have been grown I've made a few Carder characters already, and while playing around the world, I feel that the world drops [as opposed to Boss Drops] are improved... I've been seeing more Unique, Stones, Rune and especially Set Pieces than I remember in previous versions of the game. Having played through the game a few times (with newly created characters through Normal mode), I already have complete pieces of a few low-level sets. I may be wrong, but I think I remember Blizzard saying something in the sense that they were going to do so a while back, to reduce the need to run bosses – to increase the pleasure of intended gameplay – but also to discourage botting... There are still robots (though less of them, it seems) and Spammers (advertising their sites) cluttering screen after screen in public games. A great command to run in the game, given by a player help online [I wish I could remember your name, I didn't get a screenshot of it, but I thank you with all my heart!] is the command: / texting TEXT Using this command in Chat d2, when a bot comes and spams the public game
