You want to be comfortable in your own home, especially when it's steamy outside. And while the central air is great, the best portable AC units are more than up to the task of keeping you cool. So if you don't have a built-in air conditioner or just want to keep things extra cool on your summer home, portable air conditioning is a great choice. Because the only thing worse than a slow trickle of sweat down the lower back in midsummer is experiencing that indoors. We checked with Consumer Reports to find things to keep in mind when shelling out for a new AC unit. You want it to be energy efficient, so look for the New Energy Star label and double-check the noise level to make sure the device is quiet enough for you. Then choose between the window block, many of which can handle the entire room, or portable air conditioning, many of which are more powerful, and all of which are easier to store in winter. Even better if you can control the air conditioning from your phone as part of your smart home setup, so you don't waste energy during the day when you're not at home. The filter should be easy to access and easy to clean. Have you ever seen a dirty AC filter? You don't want to. Trust us. And above all, get a device that is perfect for your space. The bigger the room, the more BTU you will need. Most ACs range from 5,000 to 12,500 BTUs. Of course, the offerings are as varied as the climate. If you are in arid mesa, your best choice will not be the same for another located deep in Cajun bayou. And then there's the budget. No matter whether you have much or a little to give up, we have an option for you. Our favorites are as diverse as you are, and there is something for everyone and every dollar amount. Best Portable Air Conditioners Pro: This thing can cool, moisturize and clean the air around you. And it runs away USB power to cool the air right around you. Cons: Well, it has minimal power, so don't expect miracles. But it's great for hot rooms, or even hot outdoor music festivals. Pros: This is a great and economical way to heat and cool your home. You get climate control with this 9000 BTU unit. It has a SEER rating of 19. Cons: Installation can be a problem. Pros: The meaning of this device is the built-in Alexa, which allows you to adjust the temperature with your voice. It is also a solid 14,000-BTU unit in itself that can cool, heat, dehumidify, and recycle the air in your home. Cons: If you have a Google Home setting, the smart functionality of this AC is a bit limited. It also comes with a carbon filter that does not You'll have to pay extra for filters that you can rinse and reuse, which is kind of annoying for something that costs \$400. Pros: Honeywell Contempo portable air conditioner easily cools from 350 to 450 square feet. It has a remote control. Unlike the window block, this portable air conditioner has wheels for him from room to room. The smoothly sliding charmer wheels provide easy mobility from room to room. It has a flexible tail hose and an easy-to-install window ventilation kit. The window vent can be removed when the device is not in use. Cons: ventilation is not suitable for each window, so measure accordingly. Also, if you're not in having air conditioning on wheels, it's not for you. Pros: The aesthetics of this thing are as innocuous as possible, and the blue LED display is part of an easy-to-operate control panel located at the top of the device. It also comes with a remote control, making it easy to control from across the room. Cons: It only works in double-hung or sliding windows, so look elsewhere if your home has crank windows. Pros: With a massive maximum efficient range of 350 square feet (almost 20 by 20 rooms), this thing has a certain je ne sais quoi that others on this list lack. Once the room is cool, switch to its low fan mode, which emits a minimum 52-decibel sound. He also dehumidifies, pulling up to 60 pints of moisture out of the air a day. Cons: its exhaust hose has to run out of the window, which prevents this unit from being really portable. And it's loud. SereneLife Powerful portable air conditioner to paraphrase this spinal faucet, sometimes you need air conditioning that goes to 11. That's where SereneLife's Powerful Portable Air Conditioning Room comes in in for just a few bucks than the mid-range units on this list, you get that extra oomph when you really need it. Pros: With a 10,000 BTU output, this is one of the strongest units on the list, and most (well, probably a little more so) most numbers in the U.S. need. Although the company does not place its division range, they claim that some customers use two or three of them to cool the entire home. From our experience, we see this as a clear possibility. Of course, the device comes with traditional benefits of dehydration features, remote control, LCD reading, timer, and multiple fan settings. Cons: Oh my God, it's a 63-pound heavy hippo. Despite the company's assurances that this unit is portable, the only way we could recommend it is if it also had a steering wheel. Also, like others on this list that don't use water for cooling, you need to run the hose out of the window (parts included) for exhaust. Pros: The sleek look of this air conditioner is definitely a departure from the square models of the past, like a companion app that lets you control your device from anywhere and connect it to your existing smart home installation. Cons: This device weighs a hefty 85 pounds, so move around on the carpet, even with the wheels on. Pros: This AC cool device because it has a self-steaming technology that uses and recycles moisture collected during the cooling process to produce cool air. It also switches to dehydration as needed. It has a full full (61 degrees Fahrenheit - 89 degrees Fahrenheit) with full digital reading. Also at 14,000 BTU, it is a total cooler power plant. Cons: Like other models, you need a window for a hose. And like other models, it will also occupy the area. Each product is selected by our editors, writers and experts. Air conditioning commercial cooling gadgets The first step is to take the portable air conditioner apart, why companies don't make it easier to disassemble for me. As the average person can't be savvy DIY cleaning on their own. The air conditioner has two main parts that need to be cleaned by the vaporizer and capacitor, they will usually have aluminum fins, and that is where the dust will build up. The only way to access the vaporizer and capacitor fins is to take the device apart. Each AC block will be different, so just don't have the time and start removing the screws and take note of where they came from. There was a crazy disgusting amount of dust on the capacitor, no wonder the device was not working at full efficiency. Also, I'm sure mold and other nasty things are growing out there that may not be good for me. So to clean it was super easy, grab the respirator and remove the assembly build by hand, then vacuum the aluminum fins. I've been thinking about using a hose to wash the device, but it will make a big wet mess. Vacuum everywhere there is dust while the device is apart too. I collected the plastic case and then tested the device and immediately noticed that the air was colder. No doubt that my lungs will thank me too. I think I'll make sure to clean it up every season before use! I thought it would make a good video too, so I included it as well. I work out of my truck 8 hours a day as a security officer. My truck is my office. It's not cost effective to run my air conditioning truck all day. I built this portable air conditioner to use in my truck and it works great. Parts List 1) Wal-Mart 1 cooler) 12 volt DC Fan (My fan will run on ALTER current and DC) Wal-Mart 1) 4 inch 1/4 Bend PVC Hub Lowes Hardware 1) 4 inch RDR DR 35 PVC Adapter Lowes Hardware 1) 12 Volt DC Accessory Plug Shack S1) Piece of Plywood has already this 6) Wooden screws 7) IceCut This should be a snug fit so you don't lose air but don't get too tight as you'll have trouble removing it. Cut two holes in the plywood, one for the fan and one for PVC exhaust. Cut 3 inches of plywood little earlier than the width of the board. Screw it at the bottom of the board. This band causes the air to go further down into the cooler forcing air into the ice. Place the fan over the large hole and drill 4 holes into the fan. Make sure you don't drill in any wires while doing so. You may have to take the fan apart to find the best place to drill. Also do do make The power connector is facing the top so you can access it. My fan came up with two speeds on the switch off. The switch was on the opposite side of the power connector. I put the switch on high and installed a fan switch to the board. If I want to turn off the fan, I'll just turn off the cord. Screw the fan to the board. Make sure your fan is blowing into the cooler. Put a 4-inch PVC adapter in the hole. Put a 4 inch 1/4 bend PVC hub into an adapter. You should be able to turn the PVC hub 360 degrees. This allows air to blow in any direction. Plug the DC Adapter into the fan and the other end in your vehicles 12 volt DC accessory plug. Now you're ready to use a portable air conditioner. The air will be cooler if you use an ice bag, however the ice bag will probably melt in about 2 1/2 hours. I freeze water in 1/2 gallon of milk jugs. The ice will stay frozen for twice as long, but the air is not as cool as using an ice bag. If you use milk jugs don't fill them all the way. When the water freezes, it expands and bursts the milk jugs if they are filled to the top. If you like this project PLEASE VOTE FOR IT. My first instructable :-)) hope you like it :-)) Necessity: - 01 Styrofoam field (size: L/W/H - 60cm /40cm/50cm)- 01 mini-fan- 03 90 elbow (size 76mm)Need: - 14 pet bottles (07 bottles x 02 loading time) to make ice - Salt and salt (to make it cooler and longer)1. Pour salt water (salt makes it cooler and longer) into pet bottles (using 07 bottles at a time), put them in the fridge to make ice2. When the ice is already, put 07 pet bottles in Styrofoam box3. Turn on the fan, it will blow the air through the ice bottles of pet outside through 03 90 elbow and make the room cool :-))
