Stock market tutorial india pdf

Matt McCallJul 17, 2020 Don't miss out on the incredible megatrends that shape today's market. Get access to the most powerful market ideas and stock tips from Matt McCall absolutely FREE. Join today! Traders on the floor of the New York Stock ExchangePhoto: Getty ImagesBack to BasicsBack to basics We are all that one seemingly easy task that we never quite understood. This week, no problem too trivial, no question too stupid. Just because it just doesn't mean it's not a hack. Even if you have a retirement account or other investment portfolio, you may be confused about what the stock market really is. So let's get this straight. The stock market is a place where almost everyone can make an investment in a company by buying stocks. Buying a stake makes you a partial owner in a company, although you don't get to make decisions about how the business works. Once the business is listed on the stock market and investors start buying stocks, you can imagine that the business is broken down into thousands of tiny pieces. Every Monday we solve one of your pressing personal finance issues by asking a few ... More Terms of the stock market and stock exchange are sometimes used interchangeably. In the U.S., there are two major stock exchanges, or places where stocks are traded. Both are in New York: the New York Stock Exchange on Wall Street and the Nasdaq, which is located in Times Square. Companies tend to list their shares for trading on one of the exchanges, but not both.Companies that are traded on the stock market are usually established enough to be serious players in their industry. The company enters the stock market through an initial public offering, or IPO, which are the first shares it sells outside of any private investors who provide funds to start a company or help it grow. If a company does well and its shares are popular, the price goes up. If the economy isn't doing so hot or that the company has a bad day in the press, the price can go down. These fluctuations affect how much your share in that company you have already bought is worth in your portfolio. If you decide to sell your shares when the share price is up, you may get more money in the sale than you originally paid. If the share price has fallen when you sell, there is a chance that you will lose money. Who are these people on the trading floor? Back in the pre-day trading day, traders had to appear on the stock exchange and buy and sell stocks there. Now that most trading is done online, there are still fewer human traders needed to actually work on the spot. On July 10, the S'P 500 index reached 3,000 for the first time. And while it was a temporary boost... Read more, much of this for the show. Things are happening on the computer much less than watching this guy or this guy react to market fluctuations. (But (But everyone's favorite of this guy.) I've seen a headline about the stock market being up/down. What's up with that? When you hear in the news that the stock market has had a good day or a bad day, it doesn't mean that everyone on the NYSE has thrown a tantrum or computers have broken down. This means that index funds, which can quickly look at market indicators, perform positively or negatively. Two of the biggest of these are the Dow Jones Industrial Average and the Standard No Poor's 500. The Dow includes shares from 30 major companies, while the S-P 500 includes shares from 500 large companies that are well-established companies that tend to be of high value. While you may have individual company stocks in your portfolio, you probably also have some stock in at least one of these popular indices. But let's say, for example, the S'P 500 has a crappy day, and you know that you have a briefcase that is packed with S'P 500 stocks. Should you sell your stock and get the heck out of there? No. You have to hold on. The performance (think: popularity) of these stocks can fluctuate with the day and even by the hour. Your losses only become real if you actually sell your shares. If you hold on to them and the value of these stocks rebound, the value of your portfolio returns too. That's why you have to wait until the stocks are high to sell, although if you invest for long-term returns, as for retirement, you'll want to hold onto your investment as long as possible, historically, the stock market provides a positive return (profit) on your investment, even if it has periods of low productivity. What about bonds and other types of investments? You can buy a share of almost anything: debt, currency, gold. But bonds are big for everyday investors. When you buy bonds, you buy a company or government debt. You also do it in the form of shares. You're like, yes, I'm going to give you some money, because when you pay me, I'm going to get a little more for help. Bonds are generally considered less risky than stocks because there are fewer fluctuations in value. If the company for which you have the bonds goes under, you will be on the list to get your investment back; governments are not inclined to go under, especially in the US, it always manages to pay off its debts. The bond market is screaming. The bond market smells like a big problem. That's where to hide. Each... More We have more bond fundamentals in this post, but for now, just keep in mind that you can buy more than just shares of individual companies in the stock market. But not everything turns out to be traded on the floor of any stock exchange. Bonds don't have a central trading spot as stocks do, though you'll hear a discussion about the bond market. And sometimes, you'll hear people talking about market or just markets, and that discussion will include trading over stocks and bonds. But what do I really need to know about the stock market? Not interested in day-to-day investing news? No problem. The reason people talk about the stock market or markets is so much because it can provide an indicator of how the overall U.S. economy is doing. If the shares of one company go down, it means that there is probably a problem with the performance of that particular company. But if every stock included in the S-P 500 takes a dip on the same day, for example, something up that investors are worried about the broader business scene, maybe a discussion of a trade war, or, you know, an approaching pandemic. If markets rose? Then investors are optimistic. Tracking daily fluctuations is not necessary if you are building an egg nest in a balanced portfolio designed for long-term growth. I just finished writing a free post for All Star Charts India following on where we've been in the last two months and what last week's price action means for Indian stocks in the near future. As I wrote before the post, I noticed a lot of similarities between American stocks today and where India was just a few weeks ago. I'm going to summarize the key points, but I encourage you to read this post in full so you can really see what I'm saying below. Anyway, let's just jump into it. Here's the Nifty 50 chart on April 10, consolidating tightly below all-time highs. At the index level, the divergence of bearish momentum was a problem, but it was not confirmed, as prices were still above support at 11,555. All the stellar graphics/Optuma What is not visible on this chart is the deterioration of the domestic market is happening at the same time. Here's a quick summary of Facebook What we've seen: Momentum divergences across most major indices and sectorsSmall- and mid-cap unsatisfactory performance signaling risk aversion ToFewer shares in all major indexes hitting 52-week highs in all major indices getting overbought all Star Charts/Optuma, leading us to today's time, two weeks later, when prices finally put in a failed turnaround (through the island) and we've been cautious. Small and medium caps suffered the hardest, closing at near four-week lows. The fact is that despite our bullish medium-term forecast, we may not aggressively long stocks in the near future if prices in the Nifty 50 are below their 2018 highs. The risk has shifted downwards, and we have to respect that. Learn more about analyzing market trends to develop a profitable trading strategy in my technical analysis course at the Academy of Investment. So what does it have to the US stock market? Well, here's the Dow 30 (American equivalent of Nifty 50) 50) a similar bearish divergence as prices test their January 2018 highs. All Star Chart/Optuma We are also seeing some serious unsatisfactory results from small and micro caps over the past year, especially over the last two months. All Star Charts/Koyfin Then, looking at the broader U.S. stock market measure, we see the latest highs posted by the Russell 3000, unconfirmed by the number of new 52-week highs among its components. All star Charts/Optuma Also we do not see how the number of its components is overbought, confirming the price. All stellar graphics / Optuma Without a price confirmation catalyst, these discrepancies are not yet actionable. They can work themselves through time or price, but until they do, our thesis is to continue the short-term side hack to up resolution in the major indexes remains. It took a month for them to start unwinding in India... who knows how long it will take in the U.S. At the same time, we are focused on individual sectors/stock ideas where our risk is very clearly defined and the reward/risk is higher than at the index level. Depending on market conditions, there are times when we want to swing on fences, and there are others where we want to sit back and take some pitches. Given the mixed signals we're seeing in the short term, we'd like to argue that it's time to be patient and focus on hitting singles and doubles rather than home runs.
