

How to manage Location Services Settings for Apps

- Location Services is an optional setting that uses Wi-Fi and/or your cellular signal to determine your current location. Location data can be extremely useful for a variety of apps. For example, the Maps app can use this information to give you directions from your current location, while the Weather app can give you a local forecast.
- Location data can also be used in ways you might not expect. For example, the Camera app can use it to tag photos and videos with their exact location (known as geotagging). If you then post a photo publicly online, you're also sharing the location data for that photo.
- While it can be useful, some people may not feel comfortable sharing their location data in all of these situations. Fortunately, you can turn off Location Services for individual apps or for all of your apps. To modify these options, go to your Privacy Settings and tap Location Services.

1. Launch the **Settings** app from the Home screen of your iPad.
2. Tap on **General** midway down the list.
3. Tap on **Restrictions** midway down the list and enter your Restrictions Passcode.
4. Scroll down to **Privacy Section**, tap on **Location Services**.
5. Make sure **Location Services** is On. (for Find My iPad App)
6. Scroll down to various Apps and set the **Share My Location** to **Never**.
7. Tap on **Don't Allow Changes**.
