diagnosis and of tissue was performed with the tumor. Definitive diagnosis of this disease may include a biopsy and may require imaging. If the case is not urgent, examination of the affected tissue can be performed. In some cases, additional tests such as genetic testing may be required. The information about the tumor and its characteristics is critical for determining the appropriate treatment plan. A multidisciplinary approach involving specialists in oncology, radiology, and surgery is often necessary for optimal patient care. The treatment options may include surgery, chemotherapy, radiation therapy, or a combination of these modalities. It is important to discuss the potential risks and benefits of each treatment option with the healthcare team. Clear communication about the goals of treatment and the expected outcomes is crucial for informed decision-making.
