Toilet running water on floor

Want to save water and money on your next visit to the toilet? A simple modification to your toilet can do the trick. Web site wikiHow it says that only by filling a large plastic gallon container with sand and water and placing it inside the tank, your toilet will use less water with each flush. Most plumbers would actually recommend installing a low flush toilet instead of going this DIY route, so proceed with caution, but it still sounds like a common sense way to save agua and a few dollars. How to turn any toilet into a low flush toilet [wikiHow] Hot on the heels of news that Google is using toilet water to cool one of its data centers, it has emerged that a business hardware hacker had the same idea about seven years ago. As you'll see in the following images, though, Jeff Gagnon's computer is much more than a toilet-cooled rig - it's a case of mod tour de force. For starters, it doesn't really have an affair – instead, it has an affectionately hand-cut and painted (while topless; see below) Tux penguin backboard, which the motherboard, hard drive, and power supply are all nailed to. Then there's the waterblock CPU, which has been handmade from a piece of copper and, I guess, a welder bow or a welding iron. But where's that tubing going, I hear you're asking? Where's the water tank, the pump, the radiator? Well, it just happens that there's a toilet on the other side of the wall – and so Gagnon, who is obviously a fan of making things as cute as possible, just drilled through the wall and put a water pump in the toilet tank. There's no sign of a radiator: It looks like it's actually just an open system, with water flowing freely in and out of the tank. Here's an excerpt from Gagnon, about the actual functionality and efficiency of the system: The more we go to the toilet, the more cpu heat goes down. With this installation, the CPU heat is about 19 Celsius - very nice! After a weekend outside the house (no flushing of the toilet for a while), the toilet tank is warm and the CPU heat is about 29 Celcius... The integrated system runs ClearOS, a small and medium enterprise oriented Linux distribution based on CentOS and Red Hat. As far as we can tell, the server is placed on the wall of an office somewhere in Quebec, Canada. For more photos of the toilet-cooled, caseless masterpiece, click on the next page. You hate it when you sit in the toilet and your bomb drops into the water and your butt gets that famous water-touch Well, here's the solution! First of all, you're going to have to open the bathroom. Take one hand and grab under the rim of the toilet. Now lift it up. Take a piece of toilet paper, it should be between 8 and 12 sheets. Tear it up and I'll crumple it. After that, you just throw it in the middle of the toilet. Now you can free yourself without water touching your bottom. Don't forget to rinse the toilet, close it and wash your hands afterwards. Maybe even open the window if you have to. Mark Lobatt/Moment Open/Getty Images After flushing a toilet, the water goes down the drain pipes at the sewage treatment plant. In places where the house is far from the sewage system, sewage goes into large septic tanks. These tanks are cleaned and emptied regularly to keep the house safe. Because used toilet water is unsafe, proper waste drainage is important in order to protect and keep your clean water sources safe. When toilet water reaches the sewage plant, it is filtered, cleaned and treated to remove unhealthy content. Water is released back into the environment only when it is clean. Filtered water can be used in road repair and construction work, and treated sludge is used as manure. Manure.
