2 turn magnetic loop antenna

Finn McCuhil you may have taken a static and bad reception on your AM radio as a fact of life. The malfunction may not be with your signal or even your location in relation to the transmitting tower. It may be the fault of the antenna of your radio. The Ferrita coil antenna in most AM radio stations is a small rectangular bar that is just large enough to allow the radio to produce local stations. You can improve the reception by improving the antenna. The antenna loop, as the name implies consists of a loop or a number of loops made of copper wire wound on an unsive frame. The frame is usually made by combining two pieces of wood together to form the shape of X. On the spiral loop of the antenna, the copper winding begins on the outer edge of the X and the wound is spiral to the center. The edge-wound loop antenna uses an X-shaped frame built from 1-by-6 inch boards. The ends of the board are notched at half an inch interval and, as the name suggests, the copper wire wound on the edges of the frame. In both cases, the two ends of the wire are connected to the 365-picophade variable capacitor, which is used to set the antenna to the correct frequency for the radio station. Take two 18-inch 1-by-6-inch boards and mark on both in the middle of the point on one edge. Place two more marks on both boards 3/8 inches on either side of the middle of the point. This will give you a 3/4 inch measurement in the center of the board. Use the square to mark the slot starting on these signs and running to the middle of the flat side of each board. A 1-by-6-inch piece of finished wood actually measures three-quarters of an inch by five and a half inches, so the middle of the flat side will actually be two with three-quarters of an inch. Use a small hand to cut the marked slots out of each board. Put the boards together, leveling the slots and pushing the outer edges of the board until they reach the bottom of the slot. The result should be an X-shaped frame. Use a small handsaw to make eight, half an inch deep slots, half an inch apart at all four ends of the frame. Wrap the 22-gauge copper wire around the outside of the frame through the slots. Mount a variable capacitor anywhere on the inside of the frame and attach both ends of the copper wire to the capacitor terminals. Tune your AM radio to the station with a weak reception. Place the antenna on or next to the radio and slowly adjust the dial on the capacitor up and down. The antenna loops are directed, after improving the reception try to rotate the antenna from left to right. David Lipscomb's AM radio reception may be a little tricky given his highly directional nature. However, the characteristics of well-built antenna loops and commercially purchased units are mostly cosmetic. Since the AM reception has almost as much to do with the location as the antenna construction, you can homemade antenna loops and be that they will be almost as effective as purchased antennas. Cut the speaker wire into 20-foot length using small wire cutters. Leave one end of the wire free. Use wire cutters to rip off 1 inch of insulation from the wire speakers at one end. Crimp on 12-caliber shovel terminals bare wire using wire crimpers. Wrap the wire speaker as tightly as possible, creating about a 10-inch coil. The coil will be fixed as 12, 3, 6 and 9 hours with a zipper of ties. The screw on the shovel attracts the screws of the AM terminal on the back of the receiver or tuner. Place the loop antenna as high as possible until the reception is acceptable. Patrick Nelson Updated August 29, 2017 If you find that your HDTV antenna reception is bad with an internal antenna, try adapting your abandoned satellite dishes into an over-the-air television antenna, and take advantage of the cables in place. You will have to change the cable connection and you may need to adjust the direction of the satellite to get the best reception. Remove the Low Noise Block converter, or LNB, from the hand of the satellite dish to expose existing satellite cables. You may have to unscrew the LNB to get it. Then disconnect the satellite cables from the LNB, unwinding the cable terminals and pulling the cables across the hand of the dish. The clip is enhanced by an outdoor dish satellite dish on a television antenna on top of the rim dish, and then plug in the cables you removed from the LNB for connections to the clip-on antenna. You'll see a set of entry and output connectors marked In/Out 1, In/Out 2, and so on. Normally, you have four sets. Ignore input because it is related to apps when you want to keep using the dish. Connect each of the existing wires to Exits. Often, you'll have two, but plug them all in if there are more. Turn off the TV. Connect one of the cables that has been routed from the plate to the satellite receiver Entrance to the coaxial connector of the TV antenna, often marked as ANT. Turn on the TV and scan the channels. Disconnect the cable from the antenna connector and try another cable if the channels don't come properly with the first cable. Cables can be of different age, quality and condition. Try each one until you get the best selection of channels and image quality. Try different permutations on the roof too. I don't think I've made it any real secret that I'm technologically inept when it comes to my computer's problems. In fact, I sometimes have a slight problem with the appliances, too. I burn my microwave pizza 80 percent of the time at work and put a knife in my toaster and after puberty. So when someone gives me something technical, I usually try to pass it on to other people. Let them figure out the order, seems to have sporadic letters and numbers for me. Technical press release press release read something like: The T-1000, the latest Skynet model, is more effective than the 800 series. Thanks to the mime poly alloy, it has the ability to change shape, color and texture. Even when shot with a Winchester Model 1901 10ga level action shotgun, the T-1000 will heal itself and still rid the world of these pesky John Connors. And I would be completely ignorant of that real threat. So, with the help of a PR rep, I wrote a tech blog. In it, I admitted my inexperience with technology and how a PR person actually helped me, even though I did my best to fight it (and all THE PR). And then Andrea McLean, the new PR representative, emailed me shortly after. You opened PR anti-aircraft locks, McLean wrote in an email. Opening the floodgates for PR, like The Deep Scene Of Helm in The Lord of the Rings, I replied. But McLean wrote back: 'I love The Lord of the Rings - have seen him bagillion times. Hmm... I thought to myself as I continued to read. McLean took the step of CrossLoop, a desktop-sharing technical support app that certainly piqued my interest. But being me, I couldn't let someone in PR win that easily. So I demanded McLean answer me these three questions... 1. Get at least five words out of the word stir CHARLES DARWIN.AM: How about this: Radar, Drawn, Fraud, Pig, Drawer, Rachael, Laws, Scrawl, or this little diddy: Nerds fool pigs at war.2. I'm not even going to give you a movie. Why does Rick make Ilsa get on a plane with Victor Laszlo?AM: Casablanca is a short version because he loved her. Long version: because Victor needed the support of Ilica in his efforts against the Nazis. In Rick's famous mountain of beans speech, he says that fighting the Nazis is more important than wanting to be with her. It was a big deal because Rick was neutral about the war. In the end, he finally chose a side - against the Reich.3. What's your favorite, most underrated movie?AM: I don't follow the ratings or reviews of critics. I just like what I like. I'd say it's a tie, depending on my mood, between Sideways and Princess Bride.Her three answers were dead on. Like her pitch for CrossLoop. Think of your personal Geek Squad, McLean said. But I wasn't even sure what Geek Squad did. In fact, CrossLoop is like eBay for technical support, but you can also have a tech-savvy friend help you for free with CrossLoop, McLean explained. The reason something like this appeals to me is because I could use tech support all the time. At any point on the computer, I could probably use the tips. I have a few tech-savvy friends, but bringing them to the house and buying them a Chipotle for their time is not always effective. If they were able to me from my computer, however, it can lighten the load. And I could use technical support at home. Here at Entrepreneur, our technical support support Jamie. Jamie has successfully fixed all the problems on my computer here at work. I still don't stump it. But perhaps your company doesn't have an employee count the Entrepreneur does. I mean, how many entrepreneurs are often alone in weary hours, shackled in their home office, trying to get their company, their product or their services off the ground? When you start a company, technical support is usually not the first department filled. An entrepreneur will get someone to send a product, someone to look at in marketing schemes, someone to take care of books, and so on. So the idea of a company that advertises cheaper and immediate technical support can be something to watch as soon as your company starts to expand and actually have a network. If it suits you as an entrepreneur to invest in something like freelance technical support, the steps, according to the CrossLoop newsletter, are as follows: - Download the free CrossLoop app- Enter a 12-digit access code- Click connect to give your assistant remote access to your computer- It's completely resolution-It's entirely based on permission! if you want more, here's a little demo, complete with adorable characters. The app, available in 21 languages, according to the website, combined with marketplace, a community of more than 13,000 technology experts in more than 130 countries. Help Marketplace includes hardware support, software and app support and training. And it seems that there is a viable market for this form of technical support. Just in September 2008, CrossLoop was covered by TechCrunch, PC World and The Wall Street Journal.So if you're looking for 24/7 technical support, once your business grows outside of your friends and family helps maybe look at something like CrossLoop. Crossloop. 2 turn magnetic loop antenna calculator
