Andrew Tennyson IDEA and ACL are computer audit solutions designed to extract data and analyze. IDEA, short for Interactive Data Extraction and Analysis, is a CaseWare product. ACL, which advocates for audit team language, is a product of ACL Services Ltd. Although they are designed with similar functionality and target markets in mind, the features vary slightly between IDEA and ACL. ACL and IDEA differ very little in terms of overall functionality. Both scanning and profile data allow you to analyze, generalize and compare things like financial and business transactions in an attempt to identify and reduce risk. ACL and IDEA also allow you to archive and store financial transactions, create relational tables, establish continuous management monitoring, edit equations to collect and analyze data, and detect fraud. Both companies offer different packages tailored to specific tasks. ACL AuditExchange is a business platform designed, for example, to manage data security. IDEA has a similar product called Examiner. Because of its prevalence in the spreadsheet software market, compatibility with Microsoft's Excel software is important when comparing the functions of computer audit solutions such as IDEA and ACL. Until 2009, IDEA had a closer integration with Excel, with excellent export and import capabilities. However, the latest versions of the ACL have closed the gap. ACL now has its own set of add-ons that allow closer integration with Excel, including products such as ACL Acerno, which allows you to use Excel yourself to study the results of ACL analytics. The ACL is much more commonly used by that IDEA. As a result, it has a broader knowledge base and community support. According to a 2009 article published in the journal Internal Audit, ACL is the most commonly used solution for data extraction and fraud detection among audit professionals. Compared to February 2012, they have 89 percent of Fortune 500 companies and 98 of the Fortune 100 members. ACL also has more than 14,500 local user groups in 150 countries around the world, a feature that allows both to improve networks among audit professionals and for more in-depth and personal learning. Both companies allow you to download and test trial versions of their products. Full licensing prices vary from product to product. No company lists current prices online, as packages vary depending on the desired features and scale of implementation. Overall, the ACL is a little more expensive than idea. Monday, June 1, 2020 (American Heart Association News) - High blood pressure of any kind in young people increases heart risk Strokes and other cardiovascular events, according to new findings that shed light on the issue, experts say, have been understudied. Blood pressure readings have two dimensions. Systolic is the top number and how much blood pressure exerts on the walls of the arteries while the heart beats. Diastolic blood pressure is a lower number that measures the pressure between strokes. High blood pressure is defined as a systolic reading of 130 or higher or a diastolic reading of 80 or higher, according to guidelines from the American College of Cardiology and the American Heart Association. In young people, researchers like to know which measurements are more important in predicting the future risk of cardiovascular disease: systolic, diastolic or both? The answer is all of the above, said Dr. Donald Lloyd-Jones, co-author of the study and chair of preventive medicine at Northwestern University Feinberg School of Medicine in Chicago. The study, published Monday in the journal AHA Circulation, used information from the Korean database of more than 6 million people between the ages of 20 and 39. Researchers analyzed the risk of heart attack, stroke, heart failure or cardiovascular death within 13 years of follow-up. Those with only high systolic blood pressure between 130-139 had a 36% increased risk compared to those with normal blood pressure. High diastolic blood pressure between 80-89 increased risk by 32%. For people with high systolic and high diastolic measurements, the risk increased by 67%. There has been a real debate within the community about whether the modest height of systolic blood pressure means anything in terms of risk in this younger age group, Lloyd-Jones said. This is new and important information, and we haven't had so much data about this population before. The findings, he said, demonstrate the need to classify young people with high blood pressure as having high systolic, high diastolic or how to better identify those at high risk who will benefit from lifestyle changes or lower blood pressure medications. The study fills in gaps in knowledge about hypertension in the younger age group, said Dr. Joseph Flynn, a professor of pediatrics at the University of Washington School of Medicine in Seattle. There's a lot we know about the results of hypertension in middle age and the elderly, and there's a pretty good amount of data in hypertension in childhood. But there's a lack of data on what you're doing with 20- or 25-year-olds with high blood pressure, said Flynn, who wasn't involved in the study. This is the group we need information about. However, questions remain. Only 40% of the study participants had normal blood pressure, which Flynn said seemed very low. It was definitely amazing. As well as, he said, how many participants - from 50% to 60% - reported not receiving any exercise. Despite this, given the large The results are important for the medical community, Flynn said. Lloyd-Jones said he hopes the study provides a springboard for other scientists to study high blood pressure in young young people more carefully in other racial and ethnic groups. This study shows that the more evidence we see, the more important this issue becomes, he said. We don't want to unnecessarily label people as hypertensive, but we don't want to miss warning signs either. Published: June 2020 March 13, 2015 4 min Read Opinions Expressed by Entrepreneur Contributors are their own. Whether you're running a pole-dancing fitness business or an online Etsy store, all your management efforts and sleepless nights really get off to three crucial questions about your business - and three crucial documents to help you answer them: Related: How long do you really have to keep your financial documents?1. Do you make a profit? (Consult your net profit statement.) Profits are measured in one place: your net profit. Net revenue, which is usually the same as net sales, does not give the whole story because it does not take into account all the direct and indirect costs required to run your business. For example: If you have paid your bills recently, you know that rent, utilities, insurance, accounting fees, web and technical support all cost money. Therefore, profit is what you have after deducting expenses from net sales. This calculation generates the net income of your business. Is it positive this month? Then you make money. Good deal. But did you know you could show profit and still be bankrupt? Knowing whether you are making money is not enough; that money should be converted into cash. What is your money situation? (Consult your cash flow statement.) Cash is the lifeblood of your business. In an ideal world you pay the bills of cash generated from operations, not debts, if you want to maintain financial sanity. To pay in cash, your small business should start enough to cover the bills. Do you have enough cash to cover expenses for at least 90 days? You will find out by looking at your cash flow statement. Remember that cash for your business is like blood for your body; without it, your business is dying. Cash comes when customers pay you. But sometimes they don't pay the full retail price because of discounts or third parties like PayPal who take a percentage of the deal. Just because you take X doesn't mean you'll collect X when you make a sale. Sometimes there is also a time difference between when you complete a project and when you are paid. This is common in some service companies, but it needs to be carefully managed; otherwise, you'll just have an expensive hobby rather than a business. Related: How best to manage cash flow3. Do you build or destroy wealth? with your balance.) Building a terminal is a matter of why you are in business. The terminal cost is that you could sell the business if you decided to do so today. If you're a small business owner, what's the long game? It's just about grinding the grinding 12-16-hour days for decades only to retire when the doctor tells you? Or is it about imitating sharks on abc's shark tank, which must be so rich? They built businesses that grew assets faster than liabilities - much faster. In some cases, they sold their businesses; in others they used the business as collateral to attract venture or start-up money for new ventures. It's an amazing system when it works. So, what about your business? Do you have a small business you could sell after all? Your balance is crucial here. It measures your assets, liabilities and owner's equity, or net worth of business. This is not the only indicator of value, but it contains valuable information every banker and investor wants to know. This is the first step in determining the terminal value. Do you know how to read your net profit, cash flow statement and balance sheet? In 20 years of my business I have seen how clear it is that if you do not understand these documents, you leave a huge potential for profit and cash flow on the table. Your small business also probably carries a much greater risk of failure than you know. Would you drive a car with your eyes closed? No way, right? So don't run your small business without knowing how to answer these three key questions. Finding answers is easier than you imagine. And these answers can change your future.
