

You Must be careful

When you handle and dispose of all items in the home that contain metallic mercury.

BIOMAGNIFICATION

MERCURY CONCENTRATION

Mercury is easily absorbed by plants and fish, and the levels of mercury get higher within each animal of the food chain. Consequently, exposure to mercury through the food chain can cause death, reduce fertility, slow growth and development, and cause abnormal behavior that affects survival.

Prevent Mercury Contamination at Home

Jefferson County Environmental Services,
716 Richard Arrington, Jr. Blvd. N.,
Birmingham, AL 35203, 205-731-2880

Jefferson County Environmental Services

Has implemented a mercury minimization program to educate our citizens on the danger of mercury contaminants and the best way to safely dispose of mercury.

What is mercury?

- A natural element that is mined from ores and is toxic to humans and natural systems.
- It is a liquid at room temperature and appears shiny, silver-gray color and is odorless and can be absorbed through the skin if handled.
- Mercury, when heated, becomes volatile and changes into a colorless, odorless gas that can be toxic.

Mercury is present in the air we breathe and the water in our creeks, lakes, and rivers. Much of the mercury that is in our environment has developed through improper disposal of products containing mercury. This mercury builds up and contaminates the fish, wildlife and humans who eat the fish. It can persist for years in the environment and accumulate to higher concentrations as it moves up the food chain. Mercury does not break down; once it enters the environment it remains there and continues to damage the ecosystem.

Where do we commonly find mercury in our homes?

- Thermometers
- Thermostats
- Laboratories
- Automotive light switches
- Button type batteries
- Fluorescent light bulbs (CFLs)
- Antique glass or silvered mirrors

Use caution around items containing mercury. Never break open products that contain mercury. Mercury can find its way into the watershed through waste incinerators, landfills and wastewater reclamation facilities. Do not pour mercury into any sink or storm drain. Do not flush mercury down the toilet; instead turn mercury products into a household hazardous waste collection site. Mercury has many industrial and commercial uses. Direct human contact with mercury or excessive intake can affect the nervous system, kidneys, lungs, brain, and the immune system and is especially dangerous to pregnant women. Mercury poisoning can come from food sources, direct exposure or breathing mercury vapors.

How can mercury affect your health?

- Difficulty breathing
- Tingling or shaking of the hands
- Impaired vision
- Memory loss
- Permanent brain damage
- Impaired immune system
- Kidney disease
- Nervous system damage
- Damage to fetal development

What to do if mercury spills?

- Have everyone leave the area, don't let anyone walk through the spill.
- NEVER use a vacuum, mop or broom to clean up a mercury spill.
- Wear rubber, latex or nitrile gloves.
- Use a cardboard or stiff paper to gather beads of mercury together.
- An eyedropper or bulb syringe is useful for picking up mercury.
- Place gathered mercury in a sealed container
- Ventilate the room.
- Take sealed container with mercury to a hazardous waste collection site.
- NEVER pour mercury down the drain.
- Any clothing or carpet that came in contact with the mercury should be discarded.

Scan QR code for more information and find your nearest hazardous waste collection sites.
