"a password manager is not better than a browser, a bank, or any other device that stores your personal information," Security Now founder Nicholas K.Q: Given a  $3\times 3$  matrix  $A$  with entries in the interval  $[0,1]$ , for which are  $A$  non-positive? Consider a  $3\times 3$  matrix with entries in the interval  $[0,1]$ . Which  $3\times 3$  non-negative matrices are not positive? Thanks, A:  $A$  has zero diagonal, and at least one entry strictly less than  $1$ . Thus, if  $A$  is non-negative, we must have  $A=\begin{bmatrix} 0&* &*\\ 0&0&*\\ 0&0&0\end{bmatrix}$ . If  $\det(A)>0$ , then  $A=\begin{bmatrix} 0&* &*\\ 0&0&0\end{bmatrix}$  or  $A=\begin{bmatrix} 0&0&0\\ 0&* &*\\ 0&0&0\end{bmatrix}$ . We can then consider the other cases from here by considering the zero rows and columns. Q: Why won't this perl script work in Wordpress? I'm attempting to add a count of visitor views in the footer of the current WordPress theme for each page (or some kind of plugin). If I paste this code straight into a .html file in my theme, it runs and outputs a unique count for each page. `#!/usr/bin/perl use strict; use warnings; use CGI qw(standard); use constant MY_CACHE_TIMEOUT => 60; use constant MY_CACHE_EXPIRATION => 60; #Define our CGI object my $q = new CGI; #Global variables $GLOBALS{NAME} = $q->param('name'); $GLOBALS{SERVER_NAME} = $q->param('server'); #Stores the cache settings for each page $GLOBALS{` 520fdb1ae7
