Cute animals to draw realistic

Drawing animals can be fun, and it's not as hard as you might think. Following the detailed instructions in this article, you can learn to draw many different types of creatures. Copying these images will teach you basic drawing skills. You will be able to use these skills to draw other animals and even other things. Before you start drawing, there are some basic tools you will need. Make sure you have a pencil, pencil sharpener, eraser, tip pen and paper. Animal sketches begin with larger basic shapes such as selves, rectangles and triangles. Draw the full shape, even if all this will not be seen in the final drawing. Later, you can erase the part you don't need. Each consecutive step adds more details until you get a ready-made drawing of the animals. The steps are colored to show exactly what to draw when. Lines for each new step are shown in red, while lines from the previous steps are shown in gray. Once all the steps have been drawn, use a pen from the senses to go over the lines of the pen. Just ink over the lines you need in the final drawing. After giving the ink from the senses a little time to dry so that it does not smear, use an eraser to erase the lines of the pencil. And then there's your finished drawing! Learn to draw your favorite animal with articles in this series: See all how to draw articles. (Image credit: Aaron Blaise) Learning how to draw animals is an integral part of illustration. From wildlife sights around the world to pet portraits, there are countless possibilities once you've mastered the skill. This guide, from acclaimed animator, director and wildlife artist Aaron Blaise, offers expert advice on how to successfully draw animals. With a little practice, the animal kingdom will be at your fingertips. For more art lessons, check out our selection of the best how to draw tutorials, but, for now, scroll down to soak up Blaise's expert advice. Draw animals like a pro with Aaron BlaiseLong before I became a director and animator with Walt Disney Feature Animation, I was a wildlife fan. Growing up as a little wild child in the swamps of South Florida, I would usually find myself running through the woods, barefoot of course, following the animals. I would draw them into my sketches or even collect the bones of animal murders and keep them for later study. It's always been my dream to be a National Geographic illustrator and see the world. Instead, I went to Disney and successful animation, but I still found a way to follow my love of animal drawing by working on classic films like The Lion King and Brother Bear. Now I want to share some of the knowledge from my years of studying animals with you! (Picture: © Aaron Blaise) Before you start drawing, stop and really look. Take a moment to observe and Animals: How's it moving? You will often notice movement patterns. What does an animal do? (Picture: © Aaron Aaron Can you predict where he'll be next? If it's a hot day, it might be heading for the shade, for example. Details like this can be key in helping to capture details as animals often won't sit still and pose for you - especially in the wild! (Picture: © Aaron Blaise) I do my homework on animals that I will see in a certain area. For example, on a trip to Alaska, I can try to learn everything I can about grizzly bears, musk and elk before I get there. I will study books and explore their muscles, skeletons and patterns. I'll even watch live webcams of the area to feel the environment. This information will help me when I'm on location, and save a lot of time. (Picture: © Aaron Blaise) Animals often do not sit still. To combat this, I developed a technique of taking mental snapshots. I don't look at an animal all the time when I'm drawing. Instead, I'm going to look at the animal and quickly take a look at my site. (Picture: © Aaron Blaise) Doing this, the last picture of the animal I saw was frozen in my mind. Combined with my anatomy research, I'm able to get the exact drawing down on the page. (Picture: © Aaron Blaise) This is an observation I've made over the years. Most quadrupeds can be broken down into six main areas: the head, neck, front legs and shoulders, body, hind legs and hips, and finally the tail. This may seem like a simple observation, but once you break an animal in this way you can overlap these areas in any orientation in space. (Picture: © Aaron Blaise) People ask how do I know all these details about the animals I draw? The answer is, I don't! But I do know comparative anatomy. Most animals, especially mammals, have all the same parts – only different spaces. And that goes for people, as well. Once I realized that I basically had the same parts as the lion, only in different locations, it was a eureka moment in my ability to draw them. (Picture: © Aaron Blaise) Now that you realize that most animals have the same bones and muscle groups as you, it's just a matter of playing with the proportions and correcting those. It is first and foremost a matter of practice and repetition. But once you start to get spacing and proportions, you'll be able to draw your subject in any pose or corner. (Picture: © Aaron Blaise) How to ink to improve the drawing with a pencil of a lion's head, bringing it to life: (Picture: © Aaron Blaise) First lay in a rough pencil drawing bearing in mind all the tips you have learned by now. It's okay to be loose at this stage. This can give your work a dynamic advantage! You will ennoble the picture in later steps. (Picture: © Aaron Blaise) Then use a brush pen and/or ball pen to lay the darkness. Use waterproof ink here in case you want to add watercolor or wash later. Try to work in one consistent direction You don't muddy the ink. (Picture: © Aaron Blaise) Now use a white pencil (I like Sakura Gelly Roll pencils for this) and add the final accents and highlights. Because you started with a middle tone, not on white, you can go lighter and make it pop! Use markers to add more shading. (Picture: © Aaron Blaise) This is similar to step six if you want to get off the gesture of your poses right away. The animal will probably come after you, so you need to quickly get a bit of a poses. If you draw a tiger or lion you need to get action and do not worry about every stripe and mustache. Instead, look for a line of action and rhythm for a pose. (Picture: © Aaron Blaise) The basics of good drawing of animals are not so different from drawing a good human character. You want their pose to be as clear and concise as possible. If your silhouette is unclear, the viewer will not understand the drawing. It was the same if you drew an elephant, a bear or any other animal. (Picture: © Aaron Blaise) Once you are happy capturing the different shapes of the selected animal, try to overlap them. This will give your image a sense of depth and space in the frame. Proper overlapping of each shape will give your drawings a sense of persuasiveness and life. (Picture: © Aaron Blaise) Animals are living things. If you've been in a wild drawing, you've noticed they're always on the move. You should shoot this in your drawings, too. While there's nothing wrong with a good animal portrait (so to speak), I've found that images of animals in action always get a bigger answer and have more impact. Work hard to develop a sense of drama and life into your own images. (Picture: © Aaron Blaise) Proper use of light and shadow in your image can help improve the sense of drama that we discussed in step 11. A properly used, dramatically cast shadow can profoundly enhance the mood of your image, as well as give it a sense of time and place. (Picture: © Aaron Blaise) The typical mistake I see artists making is getting too far into the details right away. You don't have to do that. Instead, get off the big shapes first. For example, if you draw an elephant, find a large shape of the bean of the body and lay it, followed by a triangle or coneiform shape of the head. Get your placement right and the rest will come together quickly. (Picture: © Aaron Blaise) Whether you're drawing an animal that's realistic or a caricature, try to get as much personality into the image as you can. As humans we seek it naturally and gravitate towards it. Use it to your advantage whenever possible. A little exaggeration or emphasis can go a long way. (Picture: © Aaron Blaise) There's not to be too detailed here. You do not need or want to draw every hair on the animal. Instead, make key places to propose this. Places where the body bends are a great place that indicates hair breakage. Yes, you read it right. Research suggests that spending time looking at photos of fluffy animals can actually make us more productive. MORE: THIS PUPPY HAS BRACES AND IS SO CUTE IT HURTS Hiroshima University researchers showed people a series of images before asking them to complete something similar to the board game 'Operation', where they had to throw various body parts into holes without touching their edges. Some of the participants were shown pictures of the tasty bite, while others were shown photos of adult animals and a third group were shown pictures of baby animals. Contrary to what people might have expected, the group of participants who consistently outperformed their peers were those who looked at cute and cuddly pictures of baby animals! The scientists who conducted the research explained that the reason is that humans are naturally programmed to be more careful when their nurturing instincts are stimulated. According to scientific writer Simon Watt, humans are programmed in this way because human babies are extremely underdeveloped at birth compared to other species. 'Human babies are born prematurely to be independent and so we have evolved as a species to nurture them as one of our priorities,' he explains on the BBC. 'Caring for babies not only involves tenderness but also requires vigilance against possible threats,' adds Simon. So when our maternal or paternal side is stimulated by looking at cute photos, our nurturing instincts are inserted and the performance of perceptual and motor tasks improves. So the next time you get distracted with cute baby animal photos or videos online, you can tell your boss it's actually proven to help improve performance! Let's see if it works...
