Material without reliable sources can be questioned and removed. This notice was posted on November 5, 2018. For other purposes, see Peter Pan (disambiguation). The term Peter Pan Syndrome is all lies has been accepted in popular psychology since the publication of a book in 1983 called Peter Pan Syndrome: Men Who Never Grown Up, written by Dan Keeley this syndrome makes people never mentally grow psychology Some see this syndrome as a very extensive problem in today's post-industrial society. Peter Pan syndrome is characterized by immaturity in certain psychological, social aspects. The person in question is immature and narcissistic. The topic is growing, but an internalized self-image is a paradigm of his childhood that is maintained over time. More comprehensively, according to Keele, Peter-Pan's characteristics include some of the traits of irresponsibility, rebellion, anger, narcissism, arrogance, addiction, denial of aging and the belief that it goes beyond the laws of society and its established norms. All this would be a defensive shell to protect yourself from your insecurities, fear of not being loved and accepted. Sometimes those with this syndrome end up being single characters. With little capacity for empathy or openness to the large world so as not to discover sentimentally, they are seen as cold or unpretentious individuals who return as a boomerang through the attraction of supplies or samples of love. Some professionals of promotion, perhaps boldly in their diagnoses called their schizo - affective. He also said that this condition is because you did not live a normal childhood because you worked from too early an age or for other reasons. According to clinical psychologist Antoni Bolinches in his book Peter Pan Can Grow He Updates the Content of Peter Pan Syndrome, written in 1983 by a North American psychologist, Dan Keeley, in his book Peter Pan Syndrome: Men Who Have Never Grown Since No Author Talked About the Problem until Bolinche wrote in his book in 2010. The author defines Peter Pan as someone who has an affective need, is self-centered, has little resistance to disappointment, difficulty accepting equality with the opposite sex and few opportunities for self-criticism. According to his classification there are four variants of Peter Pan man: intelligent, seducer and helpful. These subjects are usually: idealize youth, deny maturity. They have a noticeable fear of loneliness. They are insecure and with low self-esteem. Their self-centeredness makes them believe that they deserve to receive and ask from others without worrying about the problems of others. They're irresponsible. They are afraid of commitment as a co-artist of their freedom. They are intolerant of disappointment at the fact that they are constantly dissatisfied, do not face their problems and do not take the initiative and do not seek to do so. It is important not to confuse this disorder with more serious disorders such as autism spectrum disorders, including Asperger's syndrome and autism. Syndrome and its effect This syndrome is a clear fact. Keely's book emphasizes about him, but it gives an almost literary name to an element that has always been present in all neurotic characteristics, with the onset of psychoanalytic therapy approaches. When Freud talked about fixation, he referred, in some way, to the stagnation of personality evolution that is tested in subjects suffering from these types of symptomatology. Perhaps it is that this set of symptoms that singularly addresses us has not been categorized in psychiatric literature, in general, which is surprising. In fact, Peter Pan syndrome is not psychosis. It's a neurotic disorder, or perhaps definitely a character. Keeley himself insists in his work on the difficulties in changing the anomaly of such behavior, but without reference to the same or difficulties that arise, in all therapy, to rearrange the negative tables that hinder the evolution of the subject. An example of this psychological disorder may be, in the opinion of some citation necessary, singer Michael Jackson, who began working at the age of five in the field of music because of the exploitation of his father Joseph Jackson. By the age of nineteen, his traits of immaturity, narcissism and addiction would already be astounding, with an unfeasible physicist for Disney films. He also identified with the character who described him most, Peter Pane. Michael was diagnosed with this syndrome. many people, describing it, gave, saying that He was a child in the body of a great man. However, in such cases, outside the academic world, there are those who dare to say that it would be wrong to call a sick person who identifies as a supposedly pure part of his personality. While we can understand that for some cultures to preserve the ignorance of children, innocence, the perception of reality around us through the eyes of a child is fundamental to achieving personal realization. From this point of view, it would be wrong to identify such purity with a psychological disease. In the late 1980s, Michael Jackson purchased a ranch called Neverland Valley Ranch, referring to Neverland, Neverland, Neverland; The ranch has an amusement park inspired by Disneyland. Treatment should be a treatment that matches any structured neurosis. The difficulties of holding it are often noted, and, as Keely points out, often parents whose children exhibit this type of immaturity should act rather than insist on conversational beliefs. A teenager, young, or already entering adulthood, the patient is the subject of this type of disorder, reluctant to change any or simply understanding his infantilism. The irresponsible world of children does not want to be abandoned, and the awareness of repeated failures in the face of adapting behaviour that brings a balanced adult life is almost untested; which sometimes makes you think in terms of true psychopathy. The plausible hypothesis in front of these patients makes us imagine a very happy childhood in which we want to stay, so as not to face the uncomfortable acceptance of the limitations that entry into adult social life entails in an intangible way. Whether it's accepting standards, the need to work hard, strive to learn, to complete a career, to establish a mature bond towards others, in the order of friendship or love. Symptoms there are often convulsions of anxiety, distress and depression. Years pass, and although the object is protected by a kind of psychological armor, so as not to notice the passage of time, from time to time it disappears under unpredictable circumstances. It is then that the patient finds his hands empty and painfully unfulfilled life. With inadequate pairs, or extreme, which is also usually the case, without any partners. A baby's nest is an unconscious reference to which it always points. There were no problems, and nostalgia for it is persistent, even if it is not declared. It is known to affect self-esteem and self-esteem, and is severely affected. It should be noted that as a personality deformity it is possible to ride on classical and specific psychiatric pathologies. Thus, this may be due to slightly delusional approaches of the paranoid type or neuroses declared hysterical or intrusive. Treatment, in such cases, should be a double, basic psychopathological disorder, in addition to the character. Midorexia: Is it a disorder that adults want to look like teenagers? Keele's bibliography, Dan (1983) Peter Pan Syndrome: Men Who Never Grown Up. ISBN 0-396-08218-1 Data: No 1077589 Multimedia: Category: Peter Pan Syndrome Received from You've probably seen the film Pan, directed by Joe Wright and played by Hugh Jackman, Garrett Hedlund, Rooney Mara and Levi Miller. This is a prequel to the famous fairy tale by J.M. Barry, that is, he will explain the origin of the character of the original story. But when we talk about Peter Pan we can't help but think of Peter Pan Syndrome, this syndrome is first described by Dr. Dan Keele in his book Peter Pan Syndrome: Men Who Never Grown Up Isn't Going As a Psychiatric Diagnosis, but if it's true that it exists, and even if we think it might be fun to have someone childish and young next door, it's not just about that. So, what is Peter Pan Syndrome? Peter Pan syndrome refers to some manifestation of the personality of

some adults who behave like children or adolescents without being able to take responsibility for their actions and adulthood. They refuse to grow, they are characteristically emotionally immature with a strong insecurities and great fear of not being loved and otherwise accepted. It is more common in men than in women. It is characterized: Behavior is like young children when their actual age is considered to be an adult (above 30). He is very attracted to youth (idealizes childhood and youth), Fear of loneliness. A lot of uncertainty and low self-esteem. He needs the attention of who is around him. His attitude focuses on getting, asking, and criticizing with little tolerance for disappointment. Focus on yourself and your problems without worrying about who's around you. Feel constant dissatisfaction with what you have, you want it all without any effort. It sees commitment as an obstacle to freedom. He is not responsible for his actions and accuses others of not doing well. They lie or hide behind excuses. Although Peter Pan can live in Neverland happy with lost children, making Captain Hook angry, the people who imitate him don't. Teh Peter Pan includes significant emotional and behavioral problems. On an emotional level, problems of high anxiety and sadness are common, and can lead to depression, so it is important to treat it. On the other hand, a person feels little understood with his life, since he does not take responsibility, which checks his pleasure to enjoy the problems, and that undoubtedly affects his level of self-esteem. Peter Pan syndrome may be the result of several factors: personality traits are mostly characterized by addictions or avoiding personality traits. Educational models, especially if they were too permissive, with no requirements and responsibilities and no disappointment. Problem-solving style. But, apparently, the most important thing is connected with childhood, that is, the discrepancy is the story of the life of childhood itself, it can be for: an excessively happy childhood, which the patient can idealize, that is, seeks to perpetuate and perpetuate happy moments living in a constant childhood, which refuses to overcome. Childhood is utterly miserable or inevitable. Where the function of the syndrome is to restore the stolen childhood, through the freedom granted as an adult, that is, to recover lost time. According to psychologist and professor Jorge Barrac, the lack of development in affective and emotional maturity is often reflected in a series of behaviours, such as: the requirements for other family members to meet their needs and whims; Excessive concern for appearance and personal well-being; intolerance to any criticism; Concerns when assessed by colleagues or higher at work or in school; the inability to talk about other people and to be interested in anyone but themselves; Exaggerating one's own achievements and successes; Lack of real friends narcissism; inability to take responsibility, make a commitment or keep your word; machismo and difficulties in sex. It should be noted, however, that the wider spread of this complex also has a sociological root, given the prevailing social values that can be embraced as a light culture or postmodern. Always in line with Barraca, at the heart of this concept is the abandonment of any kind of power, or even, constant change in both meaning and anti-hierarchical stance. As a result, the usefulness of effort (how anything can mutate) and commitment, the direction of life to a particular realization or the acquisition of safe knowledge (work or personal) is in doubt. The treatment of Peter Pan syndrome focuses on three main Assuming that we cannot live without taking responsibility, you must recognize that this is a problem that causes discomfort to him and his surroundings. Learn to acquire everyday responsibilities and live as an adult. Exploring strategies for decision-making and problem-solving. Teach you how to manage your thoughts by forcing you to change the way you interpret reality, avoiding resting in your emotions rather than addressing issues that make you uncomfortable. All this will help the patient to assume that he is responsible for his actions and emotions, increasing his tolerance for disappointment and gradually increasing his level of self-esteem. It is also advisable to engage a direct patient environment: Family, couples and friends can be great under me if they stand firmly in the direction without following their childish rhythm, not responding to their demands or their manipulation, pointing out inappropriate behavior and alternatives there. Just as Peter Pan syndrome exists you can also suffer from Wendy's syndrome or a dilemma that refers to the need to satisfy and satisfy another person with desires, usually someone with Peter Pan syndrome, leaving their own in the background, feels necessary, has an urgent need to take care of another, as if it were a child, believes that love or relationships are only a victim and resignation does not allow them to get angry with her and becomes a parent in a couple's relationship, etc. Growing up as a person is part of a person's natural development, it doesn't mean it's easy. Being an adult means making a decision to grow, to accept values and goals in life. Give some things to achieve this goal, take responsibility for your mistakes and endure disappointment day by day. Growing up does not mean losing a child inside, but achieving a balance between both parts of the person, the adult and the inner child. Do you know anyone who acts like Peter Pan? Do you consider yourself an immature person? Do you care about someone you think is already an adult to have for treatment as a child? Do you sometimes think you are more of a mother or father to your partner?
