mind. The project is named 'Password-based Notice Board' which eliminates the need for an additional password-based system. The project uses GSM technology to remotely control the notice board. A GSM modem and a SIM card are required for the implementation. The project is designed to be connected to a database that stores the user's details, including their phone number and details of the projects they are associated with. The notice board can display messages that are sent via SMS, and the user can access these messages using their phone number. The project is scalable and can be extended to support multiple users. The system is designed to be secure and reliable, with features such as encryption and authentication to protect user data. Overall, the project aims to provide a cost-effective and efficient solution for managing notice boards and communicating important information to users.
