The DOSBox emulator and all its variants, such as DOSBox SVN Daum, DOSBox Megabuild 6, vDos and vDosplus, Windows typically work inside the window like any other program. In some cases you can run it (and DOS programs) in full screen mode, and it's pretty easy, but unlike DOS, Windows is a multitasking OS, and there are some implications when other Windows programs are involved that you need to show something on the screen like Printfil's print preview. This video shows how to run DOSBox (and vDosPlus, vDos) in full screen mode and what happens when printed if print preview Printfil is enabled. Let's Go: Run DOSBox SVN Daum (or MB6) Tap ALT+ENTER to go full-screen Imitation Printing with DIR+gt; LPT1 If the print preview is included, DOSBox is minimized to Close Preview and DOSBox Run vDosPlus (or vDos) and tap ALT+ENTER DIR LPT1 creates another preview, but vDosPlus (and vDos) remains full screen until you click you can comment on a Facebook video or YouTube one on this page, or you can contact us on Other articles and videos about DOS printing in Windows I have to include FullScreenmode in Dosbox under Ubuntu 12.04. But still I don't get it in Fullscreen. My turbo C e windows are smaller than my screen size. In my previous post, I discussed how to use DOSBox to play 16 bit DOS games and run programs such as turbo C/C IDE using the front end of the D-Box app. In this post, you'll learn how to use DOSBox without any front end of the app. Here you have to write a few commands, if you are not comfortable, then stick to the DBox. DOSBox is an MS-Dos emulator that can help you launch Dos Based apps in Windows Vista, Win 7, macOS and Linux (and possibly the upcoming 128 bits of Windows 8 :) In this tutorial we will use Turbo C/IDE, you can follow the same procedure to run all other game dos and programs. Note: DOSBox should run on Windows 10 as well. Although I didn't check it. If you do, please let me know. Follow these steps to use DOSBox 1) Create a directory and call it DOSFOLDER preferably at root/c: or whatever. This folder will be installed as C: in DOSBox, you'll find out later in this post. 2) Copy all doS apps and games (like dev) in this catalog. For example, if you want to run Turbo C/IDE, copy the TC folder or an extract from the TC installation to that directory. 3) Download and install DOSBox for Windows 7/Vista and MacOS on the link provided at the end of the post. Linux users can use the package manager to download DOSbox from the repository. 4) Run DOSBox, go to the launch of all programs / DOSBox0.74 (or similar) DOSBox or desktop. The DOS emulator will open. On the title bar you can see the clock speed. 5) You'll tell you: you need to mount the folder you created in step 1, if you missed it, do it Here you will store all the programs dos and games. 6) I'm considering the way to the folder/ catalog DOSFOLDER you recently created is C: DOSFOLDER (for the simplicity of the root catalog was used) write the following lines of codes in the emulator dos: : zgt; mount c: DOSFOLDER you get a message Drive C installed as a local directory C: DOSFOLDER. You can use any email drive instead of C, such as H, I, J, etc. which is actually a virtual drive you created in the DOS emulator DOSBox. Now, let's do: C: C: If you remember or have used DOS before, it's a simple team of dos. For example, if you've saved all the Files and folders of Turbo C/IDE ie TC folder inside the DOSFOLDER folder, then enter C:gt; CD TC/BIN C: TC-BINgt;TC TC file TC.exe is in the Bin TC catalog. In the same way, you can find other Dos programs and games. If you don't remember the names, then we dir commands to list the files inside any directory. The aforementioned line will open turbo C-IDE. I think you're familiar with this code, except for Team Mount. Set up DOSBox on Auto Mount and Auto Execute 1) If you want to save some time from entering these codes every time you start DOSBox. Go to C:Program Files-DOSBox-0.74, where DOSBox is installed with Windows Explorer. 2) Now run the DOSBox 0.74 Options.bat package file that is present in the folder. The DOSBox-0.74.conf file will be opened in a notebook. Scroll down, you'll find autoexec. Just below the autoexec write the following lines of commands: DOSFOLDER zgt;C: And save the file. The aforementioned code will be automatically run when DosBox is launched. It will mount the DOSFOLDER folder and create a virtual disk. Now you can enter the name of the programs to run. 3) If you want to use only one program, such as Turbo C/C IDE or DEV. Then, after autoexec writes the following lines of commands, DOSFOLDER gt;C: the aforementioned code will open Turbo C/C at the launch of DOSBox. DBox to use DOSBox is easy if you're still uncomfortable with DOSBox. Then you will have to use some of the front apps available like ProGammaX, Sir DOSalot, DosBoxFront, Dapplegrey, DOG, DOSShell, AmpSHell, Radnor, DOSBoxer, DOSBox Gui, DOSBox Game Launcher, Boxer, DOSBoxGui, DBoxFE, etc. You can read more about how to use D-Box to run doS programs and games in Windows Vista, Windows 7, Linux and MacOS in our previous post click here. The limitations of DOSBox The only limitation with DOSBox is that you can't use some shortcuts like ctrl+F9 to run c programs. Because ctrl+F9 is one of the doSBox labels itself. Clicking Ctrl-F9 will come out of DOSBox, be aware of this. Instead, you'll have to manually click on the options. Download Free for Windows link for macOS link for Linux Download from the Linux repository for another OS visit the official website (www.dosbox.com) At any time, time, You'll find any difficulty in using the DOS Box you can use the comments section below to post your questions. If you've tried it successfully, then share your experience. Sheikhhar Sahu Hand-Picked Linked Messages Using DBox and DosBox to run Dos programs and games in Windows 7, Windows Vista in full screen compared to today's high definition games, DOS games are used low resolution, so playing old games in DOSBox on a modern LCD monitor or HDTV is not an optimal experience without some configuration. The dosbox.conf file manages how DOSBox displays old games and software. You can change these settings by opening DOSBox settings from the Start menu. Open the dosbox.conf file through the Start menu. First, I change the line that says fullresolution-original to fullresolution-1920x1080, which is the home resolution of my monitor. If the monitor is different, be sure to use its resolution (e.g. 1680x1050, 1366x768, etc.). Next, I change the output to allow for scaling and correcting the ratio of aspects. Some DOS resolutions don't use square pixels, so the aspect ratio correction keeps these games from being squished on the screen (old CRT monitors don't have a fixed number of pixels, so it wasn't a problem back in the day). Once the output is installed on ddraw, we can include aspect correction and scaling. To do this, I change the aspect/false line to aspect/true. Right after that I would change scaler/normal2x to scaler/hq3x. This will depend on your personal preferences and the speed of your equipment. hq3x scales the image by 300%, but it can make things look a bit cartoon-ish because it smooths the pixelated edge. Notice how the big red numbers in the screenshots below pixelated in the first image, but smoothed out in the second image with hq3x zooming. The results vary depending on what is displayed on the screen, but something better than nothing. DOOM is enlarged without improving or scaling. DOOM by scaling hq3x in DOSBox. Just for comparison, here's DOOM in its original resolution. It's amazing how much information game artists have been able to cram into so few pixels. DOOM in original resolution without scaling or expanding. As I mentioned, these settings are my personal preferences, so you can experiment to find settings that look good for you and give you the performance you want. Looking again at your question, I think I can see what happened to your Conf file. You set: fullresolution-1366x768 windowresolution-1366x768 That's why you get a mailbox (black on both sides). You essentially told Dosbox that your screen is the same size, your window, but your screen is actually larger, 1600x900 (or above) on Googled specs for this computer. Thus, the difference appears in black. So you have to either change the fullresolution to the actual resolution of the screen, or go back to the by default and only specify the resolution of the window. So now I wonder if you really want a full screen, although your question only asks about the box. For you get a window, but you size it smaller than the screen, hence two black stripes (letterboxing). If you really want a full screen, you need to specify the actual resolution of the screen. 1366x768 is not large enough. The next question is: what is the resolution of the program itself? It will not go past its own resolution. So if the program/game (native) say 1280x720 (HD), then setting up the window resolution shouldn't be bigger than (remember, this fixed is not dynamic when you use Ax8 as windowresolution). Example: DOS Lotus 123 will expand to just eight columns and 20 lines. The bigger the Dosbox, the more text, but no more columns and rows. Thus, installing a higher window for this only leads to more text, not more columns and rows. After that you will have mailboxes. Hope this will help you better.
