
Body planes and sections anatomy. This article is largely or completely dependent on a single source. The relevant discussion can be found on the anatomical model. The article describes how a human body is divided into different sections or planes. These planes are used in human anatomy to describe the direction and location of body parts. The body has three cardinal planes: the transverse plane, the sagittal plane, and the frontal plane. The transverse plane is horizontal and divides the body into superior and inferior sections. The sagittal plane is vertical and divides the body into right and left sections. The frontal plane is also vertical and divides the body into anterior and posterior sections. These planes are useful in medical imaging and surgical planning.
