Some context I'm using Windows and PHPStorm. I have a.php project with a simple set of classes. I've installed Xdebug 2.2.5 to work with a specific script (that I'll present to you later). Problem phpstorm has no idea to what scripts to debug when I'm using Xdebug. xdebug logs I think this is the relevant part of the output, because it's similar to the problem I have with ctrl+F12, but not exactly the same. 2015-03-25 09:24:20.320 Xdebug Connecting to configuration /usr/lib/php/20151012/php_xdebug.ini 2015-03-25 09:24:20.337 Xdebug Xdebug: enabled 520fdb1ae7
