Chocolatey packages can be published to a server, installed on multiple machines, and can be used for auto-installation. Chocolatey publishes and manages packages and solves some common problems with its built-in functions such as adding dependencies and updating packages. Chocolatey works with PowerShell and MSI, and is generally easy to setup. Chocolatey is an open source project run by a company based in Redmond, Washington. This article will help you get started using Chocolatey and install it on a Windows 10 or Server 2016 computer. Install Chocolatey on a Windows 10 machine The Chocolatey Setup Wizard runs as a background task while you are installing other software on your system, like Windows or Chocolatey. In the same way, you can use Chocolatey without installing it as a background task. Choose the "Synchronous" option in the Chocolatey Setup Wizard. In the Chocolatey Setup Wizard, choose the "Synchronous" option to start the Chocolatey setup. To set the "Synchronous" option, follow these steps: Click the arrow next to the "Accept License Agreement" button and select "Run as administrator." If you don't have administrative privileges, you'll have to log on as an administrator and do this setup in a different way. When you select the "Run as administrator" option, the window disappears, and you'll see a message saying that you selected an option that requires administrative rights. The Chocolatey Setup Wizard will take you through the installation process and ask you questions until it is finished. Choose a Default Package Source If you want to configure Chocolatey to install packages from multiple sources, like a repository on a server or a user's machine, use the "Default Package Source" page to choose your source. Select the option you want, and then click the button to add it to the list. In the Chocolatey Setup Wizard, select the first button (Default Package Source). This opens the "Default Package Source" page. Select your preferred package source and click Add. Select the default package source that you want to use when you install new packages. When you have selected the package source you want to use, click Add. Install Chocolatey on a Windows Server 2016 machine Follow the instructions in the Setup Chocolatey Wizard to install Chocolatey on a Windows Server 2016 computer. When you are finished, Chocolatey is installed on the computer. You should see the Chocolatey icon on 520fdb1ae7
